3178. 68030 instruction timing

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-07 18:23:56 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1v013sINN5hu@news.u.washington.edu>
Source record: 38227

Does anyone have the instruction clock cycles on the 68030? I can't imagine that it would be the same as on the 68000! While I'm asking, does anyone have timings for the 68882 or 68881?

Thanks,

I don't have an 030, I'm just curious. Wouldn't it be easier to work on a port of netBSD, since this is mostly machine independent? Also,

That's rather hard to believe. The base-relative code actually runs faster than absolute-addressed code. Fewer cycles are used to compute a 16-bit displacement off an address register than to load a 4 byte absolute address. Really, the shared-text compilation of gcc is intended to save execution time only; you're probably right that no one needs to run multiple copies of it at once.

I've been thinking for a long time that it might be a good idea to splinter completely from the FSF distribution, and trim things down into a 68k-specific compiler. But, aside from the added work it would require to get off the ground, it would also add more confusion to an already chaotic situation...

: personally been using RECLAIM for some while with no adverse-effects.

This was a bug on Atari's part. When they found out about it, they
decided not to fix it, out of concerns of incompatability. Consider
the situation. Suppose they had fixed it by making newer Ataris use
all the clusters. You write a floppy on a new Atari, using all the
clusters. Suppose you now try to read it on an old Atari. Chances
are, you wouldn't be able to finish reading the disk, since the old
buggy Atari will decide you've written past the end of the disk.

Suppose instead, Atari had changed the format routines to do as
RECLAIM.ZOO does. Now, you format on a new Atari. Consider what
happens when you write to that disk on a PC!! This would forever make
Atari- formatted disks incompatible with the PC world. This option
does sound like the best available to Atari, but I can still see why
they decided to do nothing.

In the meantime, if you feel that 2K per disk is that important, I see
now reason why using RECLAIM should cause any problems, as long as you
don't give those RECLAIM-formatted disks to your friends.

One thing that is NOT true relates to rumors that Bell Laboratories was at one time working on an upgraded UNIX to be called "Executive UNIX". According to the rumor, the people in Marketing figured out the acronym for "Executive UNIX" (guess how long it took them to think this one through?) and promptly killed the project.

Very interesting! - but still Atari _could_ have fixed the bug
and, to keep owners of older Ataris (who receive "full" disks from owners
of newer Ataris) happy, they could have made available the equivalent
of RECLAIM.TOS. Then even those with older Ataris could read all the
clusters. Further the newer machines should not complain either if they
see a RECLAIMed disk - for the 2 extra clusters which they _could_ read
(if only they existed!) are MARKED_BAD.

So I'm afraid the mystery remains (for me at least).

Cheers,
W. Alan B. Evans

3186. Re: 68030 instruction timing

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-07 21:39:24 UTC
From: m91der@tdb.uu.se
Message-ID: <1993Jun7.213924.20031@tdb.uu.se>
Source record: 38235

Stuart Denman (stusoft@hardy.u.washington.edu) wrote:
> Does anyone have the instruction clock cycles on the 68030?

Counting clock-cycles on the '030 is really nothing you would want to do! :-) First of all you've got the data and instruction caches to take into account. Secondly, if I remember correctly the '030 has a far superior instruction-pre-fetch function than the old 68000. The 68000 pre-fetches one instruction but does nothing with it until the current instruction has finished. I _think_ the '030 does process more than one instruction at a time which, if it's correct, will make instruction-timing dependant on what the previous and next instructions do. I'm sure there are even more problems involved in counting 68030-cycles. Maybe some 68030-wiz could enlighten us. :-)

Here's a small example of 68000 pre-fetch:

```
***

any.silly instructions

move.l dummy,d0
move.l d0,fool
fool bsr anywhere

more.silly instructions

dummy: move.w #whatever,d0

***
```

If you trace through this piece of code step-by-step then the bsr-instruction will not be executed since it has been replaced by a move-instruction. However, if you run this code without trace then the bsr-instruction will be executed since it has been pre-fetched by the 68000. This has been know to people involved in protection-schemes from the dawn of time (:-), but that doesn't make it less interesting. :-)

> I can't imagine that it would be the same as on the 68000!

Not even close! :-)

Daniel Eriksson (m91der@tdb.uu.se, den@hgs.se)

I am rather bored with this subject, but I'd like to add that the poster
of the above message is using a top of the range Amiga and a bottom of
the range Atari which obviously influences his judgement.
If you get a Falcon, get NVDI and the screen refresh issue will be
resolved. Unless there is an NVDI equivalent for the Amiga.
If you want to play games get an Amiga, for anything else - Falcon.

>Answers:
>a) one of them
>b) both of them
>c) nondeterministically distributed

C. Whichever process gets an Fread() call in first when there is data
available on the port will read the data and flush the buffer.

Previous versions of MiNT (around 0.98) would prevent this by
generating a SIGTTIN signal when the port was read by a second
process, causing that process to stop. Unfortunately the job-control
code responsible for handling this was a little buggy (processes were
being stopped unexpectedly at strange times) and when MiNT became
"production" code, Eric removed this code. Hopefully it will be back
in some future version.

So, the real answer is "d) you may or may not be able to have two
processes reading the same port, and anything at all may happen if you
do."

Cheers,
entropy

Don't be so sure. I have at times run multiple G++'s... usually resulting
in "virtual memory exhausted". If it was shared-code it would fit.
(Note that I don't think G++ can be shared-code yet).

>I've been thinking for a long time that it might be a good idea to splinter

>ground, it would also add more confusion to an already chaotic situation...

With the number of massive improvements made to the C++ compiler (and C
too, I assume) over time, I'm sure glad this "splintering" hasn't
occurred.

A new version of the PhotoCD to PPM converter was just posted to
alt.sources; pity I've never seen a full suite of _working_ PBMPlus
utils for the Atari platform.

That binding was built to the old original AES docs, which (apparently erroniously) included that pnewidx parameter. I've sent you (by mail) a fixed source module that you can compile with JAS and patch into aesfast.a.

Look in your phone book white pages for Motorola. If you're in a small town, call 555-1212 and ask for the number for Motorola in the nearest large city. Call them. Tell the person that answers that you want to order a manual. They will transfer you to their national publications order line. Tell that person that you want the MC68030 User's Manual.

They will send it to you, absolutely free.

(If Atari behaved like this, their machines might be more prevelant in the marketplace, huh?)

I don't buy that. I typically format disks that use only 3 sectors per
FAT instead of the wasteful 5 per that the desktop creates. The number of
clusters per disk is thus even more than the extra 2k RECLAIM would give
you. I have no problem using such disks on either older version of TOS,
or on MSDOS.

] So if you want a machine for doing MIDI-stuff, then you would do all righ
] with a Falcon. Even though you can do fine even here with an Amiga. Bars
] Pipes Pro are breathing Cubase in the neck, and the new Bars & Pipes that
] coming (with DSP-support) looks very interesing indeed. For ANYTHING else
] get an Amiga. No doubt about it.

No way, get an Acorn! Saw one yesterday, WOW! I'm impressed!

Sound output at over 90Khz! 8-voices (only 8-bit). MOD files at
90Khz sound IMPRESSIVE!
Animated desktop background (aquarium) complete with 'bloop' samples,
and the Multi-tasking OS still kept going with no apparent slow-down,
even while performing UUCP, and playing a 16-bit movie!. This thing
is older than both the Falcon and A1200, but it kills both of them!
(Sure, not as much software but the machine works a lot better!)

Sorry to all the Atari-only folks out there, but I WANT one of these
things, problem is, at around $2300US, It's a bit beyond my price
range!

Now, back to our regularly scheduled tech..... (No flames, just stating
a view - If you get a chance, have a look at one of these things,
the next one is adding a DSP chip to it's collection too!)

> Yes, they still exists, but if you don't like them, don't
> use them. The 1200 offers plenty of non-interlaced hi-res screen-
> resolutions.

It's right: The Amiga 1200 has better graphic abilities than a Falcon 030.
BUT: The 256-colour mode of the Falcon isn't that slow (i've seen!).
Second is: the Video Shifter of the Falcon can do better graphics if you
simply plug in an external clock in the video port. I wonder why Atari has
only implemented these lower resolutions - the Shifter is really able to do
better!
Third: You can plug anything with a screen at the falcon video port (TV/RGB/
VGA/Multiscan/SM124).
The hardware-sprites of the Amiga have some limitations and the HAM (True
Colour) mode of the Amiga is NOT a real True Colour mode because the Colours
can't be choosen freely.
After all: If you have 640x480 with 256 colours it is difficult to find the
applications which need more...

>Sound: Falcon wins. The DSP-makes better quality sound, with more voices.
> The Falcon also offers a built-in MIDI-port that lets you connect
> MIDI-peripheral.

The sound of the Falcon can do without the DSP. The Falcon has 8 channels
with 16bit 50KHz sound (CD!), 4 channels with 8bit 25KHz sound (Amiga) and
that old PSG sound from the ST (ugly).
Here is the same as with graphics: most people won't need that much sound...

>Processor: The Falcon has a 68030 CPU running at 16Mhz, wile the Amiga has a
> 68020 running at 14Mhz. That would make you think the Falcon

> at a 100% speed. Both machines has CPU-caches that will help them
> deal with bus-contention, but for other things than small loops,
> it will not help very much.

Still nobody knows which of both machines is the faster one (cause it's very difficult to compare two different machines). QuickIndex 2.1 indicates that memory fetches are two times faster with the cache on the Falcon (isn't this very much help?). Slow-down of the bus with 256 colours is only about 3%, that can only be recocnized with a benchmark. You can also add FAST-RAM to the Falcon.
Also the same as the two above: the speed of both machines is enough for the most applications.

>OS: 10-0 to the Amiga. The Amiga was built with a multi-tasking OS in mind,
> and now they have had 8 years of improving and refing it. And it
> shows. Very stable, very efficent and very userfriendly. The
> Falcons offering is a cludgy, first offering and even that shows. Slow,
> bug-ridden and completely minimal. Lacks lots of features that the Amiga
> offers.

That's right. The Amiga OS is better. But differences aren't that great.

>Software-support: A poor machine can get away with it, if it has lots of
>software (look at the PCs). Well, the Falcon has a very small user-base and
>software support really could not get much lower. The Amiga market sure
>could be larger as well, but is in a much healthyer situation. I guess there
>are released software for the Amiga-Atari in a ratio of al least 10:1.

I think you are talking about games...
There are about ten very well wordprocessors on the Falcon (Script3, Papyrus, Cypress, Tempus Word, 1st Word 4.0, the outstanding Signum!3, Calligrapher, Proword, That's Write, old WordPerfect and more), a lot of Graphic applications (MegaPaint, Arabesque, X-Act, Outline Art, DA's Vektor, Papillion, PixArt, True Paint and more more more) lots of buisness and calculation soft (LDW Power Calc, K-Spread4 , Basichart, FibuMan, First Million, BAAS, K-Fakt, Comptable etc.) and some of the best DTP-programms (Calamus, Timeworks Publ., Didot prof, Publishing Partner) and so on...
In the professional or semiprofessional market the Atari platform still has more and better software than the Amiga.

>So if you want a machine for doing MIDI-stuff, then you would do all right

Yes,

I do. I bought the card with 8 Mb. Works perfect with me (easy to install, but I recon that all TT-RAM boards are easy to install).

If I remember correctly you can install upto 128 Mb (using 16 Mb SIMMs, when they are available).

Vi ses

>or on MSDOS.

Likewise! But actually the "full" documentation of RECLAIM goes
on to explain that if you feed it a disk with absolutely NO data on it
e.g. a freshly-formatted disk - then it gives you the option to change
the No. of sectors per fat (FSIZE) and the number of Rootdirectory sectors
(ROOT). As you say FSIZE=5 is just too much for normal DD disks. Up to
850 Kbytes or more only 3 fatsectors will ever be needed.

Cheers,
W. Alan B. Evans

Don't do that! This will mean getting out of sync with FSF, and thus
missing future enhancements (Or getting them later.)

It might be nice to trim down to a 68k-specific compiler, but keep in sync
with FSF. However, reading a current tread in gnu.misc.discuss (about
stripping down the size of gcc), this might be difficult as FSF policy
is more to diverse into more platforms (and front-ends.)

Hm. Think it over: you save 2048 Bytes per disc, and you *might* get into trouble with newer versions of TOS or DOS in general. You have to process *every* disc you've got to save these 2048 Bytes per disc! The meaning: If do do this with 512 disc, you can save 1 Meg (maybe that's wrong, I'm not a computer).

And all these articles, the program and the replies are - hm, maybe 20 kb. You have to format about 10 discs to save the space we're wasting here.

Funny, isn't it?

BTW: What about HD- or ED-discs?

ketchup

A few days ago I made the claim that even in TOS 1.04 and TOS 2.06
there are bugs that effectively restrict the size of partitions
to 32768 sectors, i.e. 16 MB with the standard sector size of
512 bytes. This claim was based on some facts that a fellow
netter, Juergen Lock, found some time ago. Juergen tried to post
the following details to the net, but for some reason (local
news problems), his message didn't make it into c.s.a.s.t (at least
I didn't see it), therefore I post it for him:

>May I suggest your pal, Juergen, re-examine the code again and he may find
>that what he "thought" was a bug is not one in fact. Or, if indeed there is

:-)

>a bug with large file sizes, do tell us how to reproduce it - and at what
>file sizes does it manifest itself.

mixed `long' (more than 1 sector/cluster) and `short' (less than...)
access (Fread/Fwrite) to the the same place is the problem.. if everything
on the disk will only ever be read and written in long _or_ short chunks

without seeking around it may well be you never notice the bug.

technical: `short' read/writes go thru GEMDOS' buffer lists (root in
_bufl, $4b2) that work like sort of single-sector caches. when there
is a read or write request longer than one or two sectors it is not
splitted into single-sector requests that go thru the `cache' but
instead its done in one Rwabs, and all cache entries that are in the
sector range are flushed (forgot, written back) before. and that
check-if-in-the-range has a bug, it still thinks sector numbers are
15 bit + sign.

> Someone opined once in this Newsgroup (or allied one) that 32 Mbyte
>partitions became possible when Atari suddenly discovered "unsigned" ints!!

yes they just forgot one place... (at least) this is in TOS 2.06:

```

I have an older pamphlet by Seagate listing all their hard drives. If you can read the label on the unit, you can tell us about it. It usually starts with an STxxxx with the xxxx being the number of the unit. That will tell us about it and what we can do to help out.

C++ is in the process of ANSU standardization. Many documents have been
written, and GNU C++ is trying to keep inline with those documents.
(see comp.std.c++ for more)

> o What other (if any) implementations of C++ are available
> for the ST range of micros, and what configuration is
> necessary for each?

Comeau C++ sounds like a good compiler, and the Atari port is in progress
(for all I know, it's finished). It uses less memory than G++, and may
be faster (or may not). 4M is still probably an expected amount - it
just means you'll be able to have a few more things loaded: with G++ and
4M, you cannot use TOSWIN under MiNT with 2 windows, for example (but
you can with 8M!).

>format floppies in this "RECLAIMed" state.

Well I did put that feature in my formatter (AFMT) once but removed it once I
realised the implications. If you increase the sector count on a floppy then
you are also effectively increasing the track count. So an 80 track disk
becomes an 81 track disk. We all know that disks with >80 tracks are a no-no
since their usage can trash some drives and not only that but the 81st track
of an 80 track disk is usually not formatted. Disk copiers won't like that.

I guess the procedure is fine for RAMdisks though.

> happens when you write to that disk on a PC!!

Right, the PC would think that it there are two more clusters on the
disk than are actually available, and would run into write errors.
Therefore, the approach used by RECLAIM is dangerous. Ancient
versions of my "Hyperformat" program did the same, but I soon
removed this feature. Instead, I once wrote a TSR that hooks
into Getbpb() and manipulates the disk's BPB *in memory*, so that GEMDOS
thinks the disk is bigger than it actually is. Thus, you don't
have to change anything on the disks (-> PC no compatibilty
problems). I wonder if this utility still exists somewhere on
my HD ... if somebody is interested in this TSR, drop me a line.

That is correct. It has been in progress for some 3 years now and
a goal of a public review is expected in some 1.5 years. I'm a voting
committee member if anybody has questions.

>> o What other (if any) implementations of C++ are available
>> for the ST range of micros,
>
>Comeau C++ sounds like a good compiler, and the Atari port is in progress
>(for all I know, it's finished).

Yes and no. The "compiler proper" of Comeau C++ 3.0 With Templates for
the ATARI has been finished for months now and has been shown to be at
least as stable as any of our other phethora of ports. Ditto for the
RTL and helper kinda commands. They seems stable. What's left is
nitpicks and loose ends.

We hope to start taking order in mid-July and begin shipping end of July
or early August.

>and except It uses less memory than G++, and may
>be faster (or may not). 4M is still probably an expected amount - it

We won't know if it's faster until folks actually do *genuine* comparisons.
We checked out the memory situation a few months ago (and it shouldn't have
changed) and Comeau C++ was comfortable in 2M.

>> and what configuration is
>> necessary for each?

The *current* situation for the ST is that you will need Lattice C.
As above it can run in < 2M RAM, and uses approx 1.5M of disk.

Comeau C++ 3.0 With Templates is an up-to-date, robust implementation
of C++ literally based up (we're licensed from) AT&T USL cfront 3.0.
It is uncontestably the most diversely ported commercial C++ anywhere.
It will be available for the ST in a few weeks! Stay tuned.
(Yes, we'd made comments here months ago, but we now have things in an
imminent state of release.)

Between the Falcon and the new AGA Amigas, right now I'd say
that the Amigas have clearly superior graphics technology, and the
Falcon has clearly superior sound technology. The "side issues"
are less clear. In general, though they are both better than their
predecessors (the older Amigas and Atari ST's), they both still
have strange compromises. Take MultiTOS for example. The only
reason to bother with getting it done was to maintain some semblance
of compatibility with older software. Yet when guys went down to
a local store last week they found most of their software didn't
run. I'd say that Atari could easily have thrown out TOS as a
"basis" for the OS and gone with a better OS (OS-9000, MultiFlex)
and simply ran a TOS emulator under a new OS, and wound up with
about the same level of compatibility. MultiTOS was a complete
waste of effort. It essentially insured that Atari will NOT be
able to catch up to other OS's for at least the next 5 years.

>No way, get an Acorn! Saw one yesterday, WOW! I'm impressed!

Yeah, the Acorn is nice. I'd really like to have a Falcon,
an Amiga 1200 *and* and Acorn -- and a Silicon Graphics Indigo2,
and a SPARC, and . . . , oh well. :-)

>Sound output at over 90Khz! 8-voices (only 8-bit). MOD files at
>90Khz sound IMPRESSIVE!

Nope. Not impressive. 8 bit sound was impressive in '84.
This is '93. 12 bit sound is the minimum for "impressive" and
that's only impressive if you are comparing low end computers.
Sample rates beyond 50Khz are generally not impressive on an 8 bit
system unless you you can use it to fudge the lack of amplitude
resolution. And in that case, you're just being wasteful.
Putting it another way, the only thing 90Khz 8 bit is good for
is to create more interesting aliasing whistles to annoy your
pet dog with. :-)

I had imagined that MOVE.B was a 16 bit instruction like Bcc.S, but thinking
about it, it probably isn't (and certainly isn't if you say so).

>since their usage can trash some drives and not only that but the 81st track
>of an 80 track disk is usually not formatted. Disk copiers won't like that.
>
This is quite possibly a valid criticism (although all ST's I've used
can easily manage 82 tracks!). Nevertheless Neil's point is that some disk
copiers, when they read the bootsector and discover there are declared (say)
1644 sectors (10 sectors per track) would assume that 83 rather than 82
tracks would be needed. However this is _NOT_ the case with the diskcopier
I (and many others) use namely DCFORMAT (form Double Click Software). The
fact that the last 2 clusters are MARKED_BAD ensures that in the "Disk Copy"
option of DCFORMAT at least, only 82 tracks will be formatted and written
i.e. you get an exact copy of the RECLAIMed disk.

So the message is (if you use RECLAIM) to check whether your
favourite diskcopier as as "intelligent" as DCFORMAT and, if not, change
to DCFORMAT. Sorry, I don't have an encyclopaedic knowledge of disk-copiers
so cannot comment further.

Cheers,
W. Alan B. Evans

Seems as if old <LF> - <CR><LF> trouble strikes back again!
For a try remove all <CR>s from the file, copy it before you do
so in case something weird happens, and compile it aain.

3228. Need SM124 wiring help!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-09 19:23:18 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.93Jun9192318@wpi.WPI.EDU>
Source record: 38127

My ST came with both the SM124 and SM1224 monitors. Unfortuinately, the previous owner had decided to try to get the SM1224 to work as a VGA monitor and in the process has destroyed the Atari connector on the end of the cable. So I have one connector and two monitors...

I have the pinouts as presented by Atari in the manual, but I don't know which wire goes to which pin. Can someone help me out? I'd really like to get at least the SM124 working... It's got a yellow wire, a red wire, a green wire, a "clear" wire surrounded by copper insulation, and this all is surrounded in a weave of silver wire. According to my manual, the pinouts for Monochrome are:

1 - audio out (does this go to the speaker in the monitor?)
2 - composite video (is this any use?)
3 - general purpose out (what's this?)
4 - mono detect (this gets grounded I guess)
5 - audio in (does this go to some sort of A/D?)
6 - green
7 - red
8 - plus 12 volts
9 - h sync (I think this is the green wire on the SM124)
10 - blue
11 - monochrome
12 - v sync (I think this is the red wire on the SM124)
13 - ground (this goes to the shield, right?)

So why can't I get my monitor to work? It flickers like it's either getting no sync or like the vertical and horizontal hold are way off. The same happens for the SM1224.

Does anyone know more about the wires in those monitor cables?

Thanks a lot!

.s.

This newsgroup has been just great... Thanks to everyone who responded about my earlier questions. I'll write to you all as soon as I can!

3229. HSC 2.0 and my IDE drive - the nightmare ends

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-09 21:39:47 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Jun9.213947.4383@mnemosyne.cs.du.edu>
Source record: 38125

Well, apparently there WILL be an HSC 2.0 release after all. I got the munged IDE drive on my Falcon back on the air today, and apparently haven't lost so much as a byte of information. (I'm about to run out and buy some disks and get HSC 2.0 backed up!)

The problem I was having in recovering the disk turned out to be caused by a bit of a bug in Atari's SHDRIVER program, not in Diamond Edge at all. Once I found a workaround for the SHDRIVER bug, Diamond Edge did exactly what it was supposed to do. It (Diamond Edge) is a fine program, I highly recommend it.

I've reported the SHDRIVER bug to Atari, and they're gonna look into fixing it. (And if you ever get a symptom where, after loading SHDRIVER, *every* drive on your system becomes inaccessible, even ramdisks and floppies, you've found the bug. Opening a desktop window on any drive will show 0 bytes in 0 items. This problably indicates that a boot sector on an HD partition somewhere got nuked, and shdriver is reading an impossibly large number for the logical cluster size. It can't allocate a buffer big enough to handle such clusters, and ends up leaving DOS with no buffers at all, so all drives become inaccesible. I'm not certain of this being the cause, but Atari agreed that it sounded likely, and they're gonna investigate it and fix it whether it's this or something else.)

3230. MiNT library, Patchlevel 31

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-10 00:00:12 UTC
From: entropy@gnu.ai.mit.edu
Message-ID: <ENTROPY.93Jun9190012@kropotkin.gnu.ai.mit.edu>
Source record: 38126

I have posted Patchlevel 31 of the MiNT library to
atari.archive.umich.edu in atari/Mint/mntlib31.zoo and mntinc31.zoo.
This is a source-only release as it contains a large number of
changes, most of which have not yet received extensive testing.

Please note that this patchlevel (like most previous patchlevels,
unfortunately) has not yet been tested on Pure C, Lattice C, or HSC.
Patchlevel 32 will be released as soon as I get patches from the
maintainers for those compilers.

It compiles cleanly with GCC 2.X, but does not support GCC 1.X. It
also requires either a cross-compiler or a MiNT minixfs filesystem to
build; there are name conflicts that will cause a bad library to be
produced on a normal TOS filesystem.

See the file __readme.31 in the zoo archive, for more details.

New features you can expect to see in the next release (PL 32):

- a functional setsid()
- emulation for BSD ioctl(fd, TIOCNOTTY, 0)
- a complete set of POSIX signal-set handling functions sigaddset(),
sigdelset(), etc.
- POSIX signal mask functions sigprocmask(), sigsetjmp() and siglongjmp()
- POSIX function ctermid()

If anyone as working on (or would like to work on) termios emulation,
please let me know, as I intend to start working on this soon unless
there's something already out there or in the works.

As always, comments and patches go to
entropy@terminator.rs.itd.umich.edu and NOT to this address.

Cheers,
entropy

Ian> or on MSDOS.

I agree with Ian! I often formatted my disks on my Sun SPARC at work,
and on occasion filled it all the *way* up. On my ST I was still able
to read the files. After all, it just follows the FAT pointers. I
suppose that the problem would be a file that starts in these last 2
clusters!

3236. a game in a window

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-10 11:12:00 UTC
From: klassa@aurs01.UUCP
Message-ID: <63342@aurs01.UUCP>
Source record: 38189

Hi Everybody-

Question for y'all... I've read, on numerous occasions, that the best tack to take with regard to writing a game (or a utility or anything else) that's intended to be useful on future (and present high-end) machines is to make the thing run "in a window" so that it'll co-exist nicely with other things running under, say, MiNT or MultiTOS.

My situation is this... Using the Setscreen() animation hack & vdi blit copies & all of the stuff that goes along with scarfing up the whole display for your own use is easy and within my grasp. On the other hand, setting up windows & managing "topped" messages & whatever else comes along isn't nearly so clear to me.

So, the question is something like this -- say I wanted to write a game that runs "in a window." To do the animation, I pretty much have to use the Setscreen() hack (no?). How (in general terms -- or much more specific, written-in-HSC terms, if you'd like :-)) does one accomplish this? What pitfalls do I need to look for?

Thanks!
John

3237. NEC HDproblems...(again)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-10 11:19:36 UTC
From: p91063@cplab.ph.ed.ac.uk
Message-ID: <37075@castle.ed.ac.uk>
Source record: 38134

Sorry I mucked up the first post, but here's the old article in it's
entirety.

OK, to put it simply, I need a WINCAP file to allow me to reformat
my hard disk. The old ICD utilities (version 6.something) no longer
work now I have the drive plugged directly into the back of my
Falcon (yes I do have one!).

All the hardware is now fixed, i.e. SCSI id #0, etc. ,but the driver
supplied on the language disk only supports the official atari hard
drives, and contains a specific warning not to touch the WINCAP file.
(Strangely enough, the file itself tells you how to modify it).

Anyway, what I need are: the no. of cylinders
the no. of heads
no. of sectors/track
the data pattern to test the disk
any other relavent details needed to set up
a suitable WINCAP file (using HDX 6.something)

Alternatively, if anyone out there is using a similar drive with the
Atari disk utilities, could they mail me a copy of the relavent files.

The drive is a NEC D3861, 115Mb embedded SCSI, and didn't come with a
manual. I've spoken to the dealer that sold me the drive (~1991) but
they can't help.

It could be that the HDX utilities doesn't recognise the disk format,
(but AHDI does!?), since when I select format in HDX.6 not even the
initial dialogue appears, it just bees, then returns back to the main menu.

Any replies to e-mail if possible, as I won't have the chance to read
news for the next week or so (The university insists that I have to do
exams at this time of year, how odd?)

Thanks in advance,

john

I noticed that recently (as of the past couple days) that a new
version of Atari's HDX utiities (5.03?) was uploaded to GEnie by
Bill Rehbock (sp?). I think the docs mentioned something about
a bug happening when you filled up a partition (the next partition
getting screwed up?).

In any case, the new version is supposed to fix this problem.
So it might not hurt to get the latest copy (assuming Atari doesn't
mind it being uploaded, I'll send it to atari.archive)...

3244. HSC 2.0 - new features

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-10 17:23:40 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Jun10.172340.10960@mnemosyne.cs.du.edu>
Source record: 38143

Since I posted that message yesterday about getting my IDE drive fixed and saying there would be an HSC 2.0 release, I've gotten several mails asking what's new in 2.0. The answer is easy: long external names. The old 7-character function/variable name limit is removed; external names can now be up to 22 chars long. This was done by modifying JAS and LD to work with standard GST-format object modules by default. (You can force them to use the old DRI-format if you want to.) There are a few other minor modifications too; for example, JAS can now also create Unix a.out format object modules (but LD can't handle them). This means that you can use JAS to assemble Motorola-format source code into object modules that you can link with GNU's linker. (For that matter, you can compile C source into GNU-compatible modules too.) The linker now emits a usable link map. The preprocessor is a little more ANSI-compliant in the way it handles comments. Other minor things like that.

I could still use a few HSC 2.0 beta testers. If you're interested, reply by mail, and in the mail, state whether you're a GEM programmer or not. I have two beta distributions available, one with and one without GEM programming libraries and docs. The one without is about 200k smaller. To be a beta tester, you have to be able to receive UUEncoded mail of approximately 500k in a single message. The next beta release will go out this weekend.

3245. Fixing my IDE drive: what I did

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-10 17:32:07 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Jun10.173207.11452@mnemosyne.cs.du.edu>
Source record: 38144

I mentioned finding a workaround for an SHDRIVER bug and using it to help fix my IDE drive. I've gotten several emails asking what I did.

What I did was a Bad Thing. The current version of Diamond Edge requires that SHDRIVER be present to access an IDE drive. (Future versions will have a builtin low-level driver, I hear, to eliminate this need.) My problem was that SHDRIVER wouldn't run properly because of the way my IDE drive was hosed. Once SHDRIVER was loaded with the munged IDE drive attached to the system, all drives on the system (even ramdisks) became innaccessible, so I had no way to run Diamond Edge after loading SHDRIVER.

The Bad Thing I did was to remove the 42mb IDE drive from my rev-2 Falcon and put it in the rev-4 Falcon in place of the munged 64mb IDE drive. I booted from the 42mb drive and got SHDRIVER loaded using it. Then I pulled the cable from the 42mb drive and plugged in the 64mb drive.

Hot-switching drives is a good way to ruin the drive electronics, but I was pretty desperate. And, luckily, it worked. Once I had the 64mb drive connected with SHDRIVER running, I was able to use all of Diamond Edge's builtin smarts to fix the munged partition map, boot sectors on the partitions, and the bad FAT#1 on my D: partition.

>clusters!
>
Almost! (Your last sentence is not quite true).

Although I almost never use a PC, I've looked into this business of compatibility between the PC format and the ST. I found that the TOS "bug" merely prevents WRITES to the last two clusters - the ST will quite happily READ them and (Dr. Sobek!) it _is_ quite happy to read a small file of <= 2 clusters that may exist there - indeed it will even DELETE it, but if you do that you will NOT be able to _write_ anything in its place (without using RECLAIM or similar trick to kid TOS there are more clusters on the disk). I should add I did these tests using an IBM formatted disk on a TOS 1.2 machine.

As far as my tests show, RECLAIMed disks are fully compatible with the PC format in the sense that you can both READ and WRITE a disk full on either machine. Some comments made on this Newsgroup seem to ignore the fact that the non-existent declared clusters on a RECLAIMED disk are MARKED_BAD and so, even on a PC, no attempt will be made to overwrite them.

As far as I can see, Claud Brod's utility that does not alter the floppy but alters the total Clusters No. held in memory in the Bios Parameter Block for drive A:\ achieves exactly the same thing as RECLAIM. However it needs to be memory-resident if it is to do this automatically and thereby deprives your machine of some RAM. It also needs to worry about what you put in drive B:\ if you have one. It does, however, safeguard against using utilities (like DISK_TOOL (DT.TTP) with option "-w" that will wipe off ALL the fats including MARK_BAD marks (0xFF7)). If such a RECLAIMed disk that

subsequently had its FATS wiped were used on the PC then there could be trouble if you attempt to fill the disk. The documentation I included with RECLAIM warns against these things.

W. Alan B. Evans.

A question for Gulam wizards: The PATH and path variables allow one to run programs residing in other directories from whatever directory one happens to be working in. However, sometimes a program needs an .RSC file to run (case in point: FLASH), and Gulam does not seem to be able to find that file (even if the path is correctly set), and the program crashes. Is there any way aroun this problem?

Thanks

This isn't Gulam's problem. Flash (et al) look in the current directory
for the resource file. So you must either copy the .RSC file into your
current directory (ouch) or change into Flash's directory before running it.

Stephen

This is normal. You ground the mono detect line and the system will
reboot so it can switch to monochrome mode. If the mono detect line is
grounded before power on, it will boot to mono mode, as is the normal
situation with a mono monitor connected.
Trevor.

>So what I'd like to know is : How do I go about adding G++ to my GCC setup..?

There isn't much to it really, once you've got GCC setup. All you need is:

The executable.
gcc-cc1plus.ttp
(called gcc-cc1p.ttp or, wrongly, gcc-cc1+.ttp)

Just get the latest version you can find (2.4.3 yet?). 2.3.1 at the VERY LEAST

The library (libg++).
g++.olb (in a file like "gplibo15.zoo" or such.

Find this either packaged with G++, or separately in a file like
"g++olb.zoo" or such. Again, try to get the most recent version you
can find.

The header/include files for the library.
in a file like "gpincl15.zoo".

Set the include files in a DIFFERENT directory to you GCC files, and
set env variable GXXINC to point there.

That should be all.

Any problems, I should be able to help.

BTW, you'll want 4M of RAM.

As someone else said, this is not a Gulam Problem. Some programs
(I don't know about FLASH) will search other directories for their .RSC
files if they don't find it in the current working directory.

From the Gulam viewpoint, the most appealing solution would appear
to be to define an alias in your gulam.g file - something like (assuming
FLASH.PRG and FLASH.RSC are on drive D:\ (say))

```
alias gemflash ' pushd d:\ ; gem flash ; popd '
```

Cheers,

I'm not sure if this is the right group to mail but....
I've just bought an Atari ST with a printer but the printer had no manual.
The printer`s make and model are 'Mannesmann Tally' and 'MT 81' respectively.
I desperately need to find out what kind of printer it emulates (I'm pretty sure it's Epson) and what the dip switches do.
It would be much appreciated if you could e-mail me if you own such a printer or if you have used one,thanks in advance,
Simon

>in Europe, yet neither has made a huge impact on the IBM\Apple dominated
>United States. Will either of these new model's get their makers
>recognition in the states?

etc.

This seems a reasonably unbiased summary and not totally out of place in .tech, but there are a few mistakes/bits missing:

> Atari Falcon CBM Amiga 1200

>MIPS 3.84 2.5

One of these figures is clearly wrong - The Amiga is almost as fast as the Falcon, and faster with fastram added. The MIPS rating for the Falcon ignores the DSP, but assumes you running in a very small video mode.

>data path(bit) 16(used) 32
>address space(bit) 24 24
>max ram 14 MB 10 MB(more w/3rd party)
>type proprietary board proprietary & PCMCIA 2.0

3rd party memory expansions for the Falcon allow 32 bit RAM with an address space >24 bits using SIMMS. I suspect the same is true for the Amiga.

>DSP yes no

Perhaps you should have pointed out some of the special features of the Amiga graphic co-processor wise?

>VIDEO
>resolution-minimun 320x200 320x200
> -maximum 640x480 1280x400\640x960(interlaced)
>palette(colors) 262,144 16.8 million
>maximum displayed 65,536(640x400) 256,000(all res)
>overscan yes yes

The Falcon is capable of any resolution with 2/4/16/256/65535 colours possible with a pixel clock of either 22 or 44 khz. It can also do interlaced and line-doubling modes. Other modes are possible with an external pixel clock. So the graphics capabilities of the two machines are similar except that the Amiga has better custom graphics chips and a bigger palette.

>type multitasking gui multitasking gui

Falcon's has memory protection. Amiga's is notorious for crashing the whole machine horribly.

> As of this writing(2/8/93), only the Amiga 1200 is currently

Well, since you are American and it is currently June, this is likely to be out of date.

>include a DSP. The NEXT computer is the only other computer with a DSP,

And it is no longer made (although may be made by another company in the future).

- Leo

>
> So what I'd like to know is : How do I go about adding G++ to my GCC setup..?
>
> I know that I have to download some C++ header files, but what about libraries

You need 3 additional things at the minimum:

-- gcc-cc1plus.ttp (or gcc-cc1p.ttp if you are UNIXMODE impaired). put
this in the same place that you have gcc-cc1.ttp/gcc-cpp.ttp etc.

-- libg++ include files. put these in a directory and have the
environment variable GXXINC point to it.

-- libg++ library binaries (g++.olb). put this in $GNULIB.

All of the above should be on atari.archive. the current Patchlevels
are:
gcc 2.4.2 pl1
libg++ pl 19

cheers,

>> Gulam and PATH and .RSC files
> some programs only search the current directly, some search other dirs

Hang on a sec here -- it's the AES that searches for .RSC files, not the program. And, the AES will search all the paths listed in the PATH= env var in the current program's environment.

I've never had a problem with the AES failing to find a .RSC file that appears in one of the directories in the PATH= list. I do always use semicolons (not commas) to delimit the paths in the list, and I always put a terminating backslash on each pathname, eg:

PATH=C:\USR\BIN\;C:\BIN\;C:\LC\BIN\

It might be that the AES requires either the terminating backslashes or the semicolons as opposed to commas. I'm not sure.

>pre-fetches one instruction but does nothing with it until the current
>instruction has finished. I _think_ the '030 does process more than one
>instruction at a time which, if it's correct, will make instruction-
>timing dependant on what the previous and next instructions do. I'm
>sure there are even more problems involved in counting 68030-cycles.
>Maybe some 68030-wiz could enlighten us. :-)

No, the 68030 is executing always one instruction per cpu cycle.

> any.silly instructions
> move.l dummy,d0
> move.l d0,fool
>fool bsr anywhere
> more.silly instructions
>dummy: move.w #whatever,d0

This piece of code will never work on a 68030 properly because of the
instruction-pipeline and the instruction-cache.

>overscan yes yes

Allthough the Falcon can do 1600x600 intl in 16 colours non vga mode (with no additional hardware) it's not a very productive mode (it has an aspect ratio of 2.66, which is better than the Amiga's 1280x400 which gives 3.2 in aspect ratio, but still stinks). Maybe I'm confusing this with overscan-mode.

>HELP ME! I have about a million questions about GNU C and MiNT.
>For instance, how do I use the MiNTLIB instead of the standard libraries?

You have two choices: either use the MiNT library exclusively, or have them both coexistent on your system. The normal names are gnu.olb (the library) and crt0.o (run-time initialization). The alternate names are mint.olb and mcrt0.o. If you choose to have both libraries on your system you use "gcc -mint" to select the alternate library names. If you have only one version of the library, you may just use the gnu.olb and crt0.o names and never use the -mint flag.

>How do I know I have the latest archives? What are the updates directory

You have the latest archives if you don't see any newer ones :-).

>for? What are the GNU things in the MiNT directory for? How do they
>differ from the archives in the GNU directories (on a.a.u.e). If I want

The updates files contain source code patches for the library and many programs ported to the TOS library, by bammi@cadence.com. If you're only concerned with the library, and not the other programs, then download the most recent version of the TOS library source code and any updates that are more recent, apply any patches for the library from the updates, and then build the patched library. Thanks to Howard Chu we applied pretty much all of the updates to the source archives a few months ago; but things have moved on since then and I'm not sure how in-synch we are at the moment.

The GNU programs in the Mint directory are compiled with the MiNT library. They respond better to MiNT signals and some of them are compiled base-relative (see other threads for related discussion).

>to use GNU C to compile UNIX programs for MiNT and TOS what is the best
>way to do this? And what type of UNIX system should I compile for (sys V,
>BSD, etc.). What are the naming conventions for the libraries, because I

Both libraries provide UNIX emulation. Of course MiNT is more UNIX-like than TOS so it's easier to port some UNIX software to MiNT and the MiNT libraries.

Both libraries currently provide a mishmash of BSD, SysV, and POSIX emulation, and often not very consistently one or the other (though I'd venture that most functions are more SysV-ish.) I'm working on cleaning this up a bit; hopefully in the future you'll be able to

define a preprocessor symbol _POSIX_SOURCE, _BSD_SOURCE, or
_SYSV_SOURCE when compiling your program, to select the emulation type
you desire (this feature is new to the soon-to-be-released patchlevel
32 of the MiNT library, and will be used to select differing
behaviours of setpgrp(), getpgrp(), setjmp(), and longjmp()
functions.) The _BSD_PGRP flag used in patchlevel 31 will be replaced
with _BSD_SOURCE in PL 32.

>want to delete all the archives except for the 16 bit 68000 and 32 bit
>68020, not the other combinations. How do I specifiy the libraries? Will
>GNU C choose the proper variations?

The standard name of the 32 bit library is gnu.olb, and the alternate
name is mint.olb.

The debugger-symbolic-information version (for use with gcc -g) has a
'g' postpended to the basename (e.g. gnug.olb). There is a problem
with the -g flag that produces strange errors and warnings (at least
on my somewhat out-of-date gcc) so these files are not produced by
default for the MiNT library.

The 16 bit library has the number 16 postpended to the base name (e.g.
gnu16.olb).

The base-relative version has a 'b' prepended to the name (e.g.
bgnu.olb, bgnu16.olb).

The 68020/68030 version has 020 postpend, bgnu16.olb).

The 68020/68030 version has 020 postpended to the basename (e.g.
gnu020.olb, gnu16020.olb)

>Anyone know how to use GNU C as a cross-compiler for generating 80x86 code?

Sorry, can't help you with that! (No, I'm not Intel-bashing here, I
just don't know :-)

I've no real wish to get involved in this drivel which should be in .advocacy
but the A1200 uses an 68EC020 which has only a 24 bit address bus; replace
the CPU and you can get past 16M but with the onboard CPU you are 'limited'
to 16M (which personally I don't consider a limitation for a home computer).

>...
>Falcon's has memory protection. Amiga's is notorious for crashing the whole
>machine horribly.
>...

I'm sorry I simply don't buy this for modern versions of C= WB/KS. For
versions of WB/KS >=36 they are reliable; >=39 they're downright good.

3267. MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-12 02:56:25 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C8HMu2.JqH@sdf.lonestar.org>
Source record: 38047
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've compiled MiNT 1.04 but the MINIX.XFS crashes my system now. How can I fix it? I've tried to recompile MINIX.XFS but GCC gives about a thousand warnings and then gives up and tells me Error 1. If anyone has a version of MINIX.XFS that actually works with MiNT 1.04 then please E-Mail it to me. My address is evanlang@sdf.lonestar.org

The second problem is that many programs die a horrible death. MiNT tells me it encountered an illegal instruction, and I KNOW these programs don't have any illegal instructions. Could MiNT itself have gotten some non-68000 instruction in the compilation by mistake. For instance, I can crash the system just by first moving the item selector (LGSELECT), and then clicking outside the selector. Instead of dinging, it crashes with illegal instruction. If I do this from within a program instead of from the desktop then I can continue, the next file selector call pulls up the standard selector. And any program that crashes does NOT free memory properly (after 3 or 4 crashes of a decent size program, I run out of RAM, on a 4MB machine)!!!

Next is that when I compiled MiNT, the Dlock function had aliasdrv defined as an external declaration, and it shouldn't have been (according to GCC - file dosdir.c, lines 1254, and 46). How can I fix this, and has anyone else had thisproblem?

t also couldn't find prgflags. The only one I have is a GEM version, where do I get a TOS version that accepts the same arguments that MiNT's makefile wants to send it (I just set the 2 TT flags and the fastload flag)? If it's uuae then give me a full path and filename so's I can get it.

If anyone that knows is reading, like ERS, can I get bios device numbers for devices by using Fxattr on the files in the U:\dev\ directory? It didn't seem to work (should it have worked and I just programmed it wrong?). How does one find out if \dev\aux and \dev\modem2 refer to the same device without checking in the Bios (my idea was to use Fxattr and check the 'dev' field.

OK, where can I get developer documentation for MiNT/MultiTOS. I have some man pages for v.0.9 of MiNT but those are highly outdated it seems, and it doesn't tell how to use the "modified" versions of old OS calls. It looks like Fopen has some new options?? I didn't see an Flock in the manual pages, is this in MiNT, is it automatic, or it is a flag used in the Fopen mode?? File locking is pretty important in a multitasking enviroment. Also, I wanted to use Dlock to lock serial ports by getting their device numbers as above. But I have no idea at all if that will work (I think it should work that way, but what do I know???!!)

Let's see here ... I guess that's the last question, for now. Thanks...

evanlang@sdf.lonestar.org

I was intrigued when I read this - I thought this is a new trick with GULAM that I'd been unaware of. But when I redefined the PATH in my GULAM.G file in the way suggested above, far from GEM programs suddenly managing to find their .RSC files without pushdirecoring into their home directories, I found that my GULAM simply vomited i.e. would not accept the above form of PATH at all!!

And, as far as I know, the GULAM I use is the latest released version.

What am I doing wrong?

Ooops. I guess I should have mentioned I don't use Gulam. What I
showed is the PATH= variable as I use it with GEMENV. (And, as it
appears in the environment passed to spawned programs.)

Matija.Grabnar@ijs.si (Matija Grabnar) writes:

>I expect to buy a Falcon and a SVGA monitor within the next month or so.

If you want to install *any* resolution extension (Hardware: BlowUp030, Screenblaster or Software: FalconScreen2 (PD), BlowUp030(Soft) or BlowUP(from ddd), you should get the best monitor you can afford. The monitor should scan the horizontal frequency from (at least) 30 to 50 kHz. These monitors are often (but not always) called Multiscan monitors. If you want to use the RGB/TV resolutions on the same monitor it should scan down to 15 kHz.

>Can anybody please tell me what is the difference between screen blaster
>and BlowUp030? Will NVDI Falcon work with both?

The hardware seems to work similar but the software of both are very different:

With Screenblaster you have to use the 10 or 15 resolutions the programmers meant were nice. Every time you boot or switch the resolution you get a TOS-Screen where you have to select your next resolution. I've seen it at a local dealer in V0.9beta and it seems neither flexible nor user-friendly.

The BlowUp030 Software allows you to set any resolution at any vertical frequency interlaced or noninterlaced (if the FALCON is fast enough and the monitor good enough for that). You can use many sliders to manipulate Vsync, Hsync, etc. in order to get the best picture on your monitor. You can save for each colour mode (2, 4, 16, 256, TC) two favourite resolutions. With a small ACC (PRG) you now can set your default resolutions for each colour mode (User defined 1 and 2 and the original resolution). If you change the number of colours on the desktop the default resolution will appear without rebooting or a bad TOS-Screen. The compatibility modes still work fine.

Both products support virtual screen (very fast and really nice).

NVDI 2.50 works fine with both Hardware products but not with FalconScreen2. The problem is that the author of FalconScreen still didn't receive the NVDI-Update!

>Should I take both? How much would they cost and where can I buy them in
>Germany or Austria?

Both makes no sense until you can use only one of them the same time.

Screenblaster (Overcan GbR, Berlin) costs DM 149.- and DM 199.- with NVDI 2.5 (without manual). BlowUp030 Hard 2 (EMail: acher@informatik.tu-muenchen.de) costs DM 129.-.

3272. Noise interference on my TT's audio RCA outs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-12 23:21:50 UTC
From: umcordes@ccu.umanitoba.ca
Message-ID: <C8J7KF.BLC@ccu.umanitoba.ca>
Source record: 38173

There is considerable noise intereference on my TT's RCA audio out jacks. It includes humming and fuzzy sounds, which can get quite loud and cause considerable degradation in the quality of the sound my TT is actually trying to play.

I have tried many things, but it seems as though the problem is internal in the TT. I noticed that the power supply is right next to the audio ports. Could this be the problem?

Would it help if I somehow was able to add more shielding in my computer (between the ps & audio ports)? If so, how would I go about doing this.

+of PATH at all!!

Nope. Gulaam uses ; to separate commands, so it will try to execute c:\bin\
and then c:\lc\bin\ when you do set path= etc. If you enclose the path in
quotes, it seems to treat the semicolon as part of the directory name.
Something of a no-win situation. (: I think that chap's pushd solution is
the best way to do what you want.

Look at my .signature ;-}, or as I'm here, you can ask here.
The brief rundown is that Comeau C++ 3.0 With Templates is the most
robust, up-to-date, and diversely ported commercial C++ anywhere.
The ST port has been going on for a while and has reached a good stability
port and hence will be released soon (we hope to start taking order in July).

3275. Help MiNT 1.04

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-13 13:45:45 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <1993Jun13.134545.7648@ibr.cs.tu-bs.de>
Source record: 38181

Help!

After using MiNT 0.95 for some time, i want to have a more
recent version.
I got MiNT 1.04 source, MiNTLiB PL30 and tried to compile
everything, were i got some errors:

I can't build genmagic.ttp because of some errors in string.h,
i'll try again when i get MiNTINC30.
I used Turbo C (1.1) to build genmagic without problems.

I can't build asmtrans because of a missing ___main, well,
gcc242.txt said i should bind a dummy ___main to fix this, which
i did.
The same thing with mint.prg.

After that, i copied everything to my auto folder, moved mint.prg to
mintnp.prg and rebooted.

MiNT came up with copyright message saying it is a multitos kernel,
which it isn't, because i commented -dmutitos. After that
nothing happens (I asume MiNT is looking for multitos).
The system does *not* throw bombs, as i expected, because i'm using
a ahdi4.0 compatible HD-driver.
I have no other autofolder programms active and only TOSWIN.acc in my
root.

Where is my error?

Thanks in advance

Axel Kielhorn

Yes, they are able to do that.

3282. Re: Help MiNT 1.04

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-14 10:11:03 UTC
From: Geoffrey Spear <gspear+@CMU.EDU>
Message-ID: <4g74ury00WB7MDW2Bj@andrew.cmu.edu>
Source record: 38182

The makefile for MiNT 1.04 (I *just* finished compiling it myself about an hour ago... what a coincidence...) has 3 lines mentioning MultiTos and something about the 030. 1 of them was already commented out. I commented out the other 2 as well, to use no MultiTos and no (I think this was the other option) memory protection (I have an old Mega 4 ST). I also had to change gcc in the Makefile to /usr/bin/gcc, and set RM = /bin/rm; apparently the version of make I have doesn't check the PATH variable correctly. I compiled it using the newest version of GCC in the Distrib_Kit on atari.archive, running under MiNT 0.95.

I had tried to compile v1.04 a couple of months ago, without success. It worked fine this time, though. Just make sure you turn off any MultiTOS and 030 switches (if you have an older ST) in the makefile and it should work fine.

This .sig is $hareware. If you use it for more than a month, send me all of your money, then see a psychologist. Or kill me.

Source record: 38183

hello,world!

Recently, i decided to re-compile BASH, the bourne-again-shell
for mint and minix filesystems.
Everythings is ok, except for the readline library.
This Library is resposible for the "line-editing" features.
I have a valid /etc/termcap and i am using the termcap.olb from
the mint libraries, but i did not make the readline stuff work, yet.
I can use it to read input from my keyboard, but i cannot
use the cursor keys for editing or for recalling commands from
the history function.

Does anyone have a working "readline.olb" or can you tell me what to do
to make it work ? (I am using gcc 2.3.2, the MiNT libs at PL 30 and MiNT 0.95.

Thanx for any help,

Frank.

3285. Hard Disk problems with Minix

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-14 11:29:30 UTC
From: vctec@sun.pcl.ac.uk
Message-ID: <1993Jun14.112930.18989@westminster.ac.uk>
Source record: 38186
Cross-posted to: comp.os.minix,comp.sys.atari.st,comp.sys.atari.st.tech

Dear folks,

Please help me.

I recently bought Minix v1.5 for the Atari ST, second hand.

My problem seems to be that I cannot install it onto my hard drive, because of the fact that my controller is not recognised by minix using the command:

dd if=/dev/hd5 of=/dev/null count=200

I get the error message:
0.00 in
0.00 out

My set up is:
Atari 1040 STe with 2Mb RAM and TOS 2.06
720 K external Disk Drive
48 Mb Disk Drives Ltd Autobooting Hard Disk.
the components of which are:
48Mb Seagate ST157N SCSI Disc
Disc Drives Ltd DMA-SCSI interface
SCSI out, DMA out ports
Inbuilt clock
Switch for SCSI and AHDI compatability.
I use the SCSI compatability option (however, I tried the AHDI with minix and it still did not work).
Mono and Coulour monitors
Daatascan Scanner.

All the above are plugged in at the same time.

Is there any way of getting around this problem without having to resort to buying another interface?

I have tried to get in touch with Disc Drives Ltd, but it seems that they do not exist anymore. Even the reputable companies here haven't heard of them. The company was based in Kent.

I bought the drive second hand, so I do not know who to turn to.

Please help.

3286. MDK tar is faulty(maybe)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-14 13:58:14 UTC
From: sjg@phlem.ph.kcl.ac.uk
Message-ID: <1993Jun14.135814.1142@sol.ctr.columbia.edu>
Source record: 38188
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

A word of warning here.

I've just had an error under minixfs 0.6p4 that fsck couldn't cure
(I ran it several times, and all it did was alter the location as
far as I could see). Anyway, I decided to tar everything to floppies,
run the new minit and untar back from floppy. Tarring went fine...

tar cvMf /a/unix.tar

[Create Verbose Multivol tarFile]

... for multi-volume archives (it just asks
you to put in a new disk when it gets full). So then I minit'd the
disk, and started to re-install...

tar xvMf /a/unix.tar

... which worked great for the 1st floppy.
Then it said "put in vol #2..." and I did, and it said this was out
of sequence. (alarms start ringing). The problem was that tar had
the wrong blocking factor (between the end of the files on vol #1
and the beginning of the files on vol #2 it had missed bytes, so it
couldn't restore the files which traversed volumes. Oh B***er.)
(B***er == Bother, for the humour impaired :-)

So, my advice (if you use tar to back up) is to set the amount that
tar writes to each volume (using the -b option), otherwise you'll lose
stuff.

It's quite an amazing proof of Sod's law, actually. I mean, I didn't
lose anything useless - it was stuff like gcc-cc1p, gcc-cc1, tcsh, ls,
rm, mv etc. Incredible!

I'm writing a newer version of SETUP and INSTALL using Warwick's gem++
library. Hopefully this will sort out the problems GFA was having with
TOS versions less than 1.4... At least, this is my excuse for why I've
not done anything to the MDK for the last month or so...

Simon.

3287. help getting MIDI in faster

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-14 14:25:26 UTC
From: censjg@clust.hw.ac.uk
Message-ID: <1993Jun14.142526.10259@cee.hw.ac.uk>
Source record: 38190
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm writing code to grab midi data and retransmit it on the RS232 port
so I can send/recieve MIDI stuff on my Sun. It works ok as long as the
block of data from the MIDI device is smallish. When I dump all patches
in my MIDI FX, I seem to be loosing some data.

None of this is a surprise. I'm using Turbo C/Bconin/Bconout to talk to
the ports, so I tried prioritising my polling (eg only think about doing
anything else if there's no MIDI data to read) and buffering the MIDI port
in my code (ie made MIDI read a tight loop to grab data & stuff in a buffer)
which helps, but it's still less than ideal. What I really need to do
is either:

a) Increase the hardware buffer associated with the MIDI port
to ~6K (is this possible?)

b) Use assembler routines, preferably interrupt driven, to get
MIDI data and stuff it into a software buffer.

I've done b) before with a lowly Sinclair(Timex?) ZXspectrum and it managed
to keep up with MIDI traffic, I'd like to do the same with the ST.

I need help with how to do this. I would prefer to use C, but could use
assembler though I don't know much about 68000. Can anyone offer help?
Things like "Here's an assembler routine to handle interrupts caused by
MIDI data arriving" get a BIG gold star, though even little things like
references to other code, books, etc are all gratefully received.

Here's hoping....

3290. New versions of cpp and mit2mot uploaded to a.a

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-14 15:14:34 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <740070872@amazon.cs.duke.edu>
Source record: 38041

I've corrected some minor bugs in cpp and mit2mot (thanks to Bill Rosenkrantz for pointing out many of the latter), and uploaded cpp v1.0.2 and mit2mot v1.0.1 to atari.archive. Look for them in the Programming/ directory as cpp102.zoo resp. mit2mot101.zoo

The fixes, in a nutshell:

- cpp now interprets its -f and -W options correctly (apparently I broke it just before the first release -- sigh...).

- mit2mot parses string literals correctly, and accepts more GAS-specific extensions to the MIT syntax, including temporary labels, #comments, and labels with .'s at the end. It should now be able to handle the output of gcc -S correctly.

And while we're on the subject of MIT assembler syntax, a few questions arose during my recent work on mit2mot that perhaps someone here can help answer:

- According to the GAS docs, '|' can be used both as an arithmetic operator (presumably bitwise OR) and a comment delimiter. The obvious question is, how does the parser tell the difference?

- There are a few addressing modes (notably the `020-specific ones like `memory indirect postindexed') that mit2mot can't translate, simply because I don't know the appropriate Motorola syntax to generate. If someone could provide me with a pointer there, I'd be much grateful.

And as always, in the event of the unthinkable, bug reports can be sent to this address.

3291. MegaSTE HD problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-14 16:26:30 UTC
From: cordes@ac.dal.ca
Message-ID: <1993Jun14.132630.14390@ac.dal.ca>
Source record: 38043

My MegaSTE 4 has been running happily for nearly 2 1/2 years now, but this morning when I switched on the monitor and tried to run Uniterm from the HD, I found I couldn't access the internal hard drive (ST157N). I had left it on Friday with everything except the monitor turned on, and it was still set up in STalker when the monitor came on this morning; so there clearly hadn't been any power interruptions causing a reset.

To continue the story, when I coldboot, the hd light blinks 8 times. I have a list somebody once posted for blinking error codes for some other Seagate drives, which say that 8 blinks means: "The controller is unable to read its own control microcode from the drive".

Does anyone know if this is the case for the ST157N, and much more importantly, what does it signify (in practical terms) for me? i.e. what can be done about it?

Any advice on this problem will be gratefully received. Thanks.

John

3292. No more GESoft TT-RAM board??

> making a game run in a window

IMAO, trying to make a non-trivial game run in a window, especially a game that involves animation, is a silly idea. You're gonna have enough trouble with MultiTOS making your system run so slow that the game will be unplayable as it is, trying to do your animation via VDI calls on top of that will result in something nobody wants to play anyway.

To be MuliTOS friendly, just have a way to suspend play and put up a menu bar that has a 'resume' option, so that the user can suspend play and access other applications. While the game itself is running, do a wind_update(BEG_UPDATE) and wind_update(BEG_MCTRL), then take over the full screen, change video modes if you need to, and let your game run. When the user suspends the game, restore the original video mode, do a form_dial(FMD_FINISH, 0,0,0,0, RECTVALS(&gl_rwdesk)), wind_update(END_UPDATE) and END_MCTRL, then put up your menu bar again.

```
> How do I read the system timer?

If you're programming in C, you can do it like this:

long gettimer(void)
{
return *(long *)0x4BA;
}

int main(void)
{
long thetimer;

thetimer = Supexec(gettimer);
}

The main point being, you have to access the timer in supervisor mode.

Well, the STE is the same way, and I was going to add some shielding but when I opened the case I found the shielding inside could withstand a nuclear blast should the need arrise. It was just full of shieling on top of shielding.

However, the Falcon has its audio section AWAY from the power-suppy and its shielding has been redesigned. I would suggest you get some sort of noise filter for your TT. I have mine running into a an expander and noise gate system on a professional rack system (OK its not FOR the computer, its for my guitar, but they all get hooked together).

>in the compilation by mistake.

Did you define -DONLY030? If so, your version of MiNT won't work properly
on a 68000.
If not, what version of TOS do you have?

>t also couldn't find prgflags. The only one I have is a GEM version, where do
>I get a TOS version that accepts the same arguments that MiNT's makefile wants
>to send it (I just set the 2 TT flags and the fastload flag)?

It's not all that important: if you don't have a TT, only the fastload
flag will make any difference, and you can set that with the 'setfast'
program that comes with gcc. Or you can set the flags by hand, as you
did. (Indeed it is the 2 TT flags and fastload bit that are being set.)

>If anyone that knows is reading, like ERS, can I get bios device numbers for
>devices by using Fxattr on the files in the U:\dev\ directory?

No. Or at least, not for the purpose you're looking for, namely comparing
U:\DEV\AUX and U:\DEV\MODEM2, because those are very different devices.
AUX is an alias for "whatever handle -2 is pointing at", whereas
MODEM2 is a real BIOS device.

It is often possible to use Bconmap to find out where AUX is pointing
(assuming that it is pointing to a BIOS device and not to a file or pipe).
But are you sure you really need to know this particular information?

>OK, where can I get developer documentation for MiNT/MultiTOS.

Call Atari at +1 408 745 2000 and ask for developer support. If you're
not already a registered developer you'll have to become one.

> I didn't see an Flock in the manual pages, is this in
>MiNT, is it automatic, or it is a flag used in the Fopen mode??

Flock is essentially just another interface to the Fcntl file locking
operations which are described in the MiNT manual.

>Also, I wanted to use Dlock
>to lock serial ports by getting their device numbers as above.

Dlock works only on disk drives. Someday it will be possible to use
the Fcntl file locking mechanism on files in U:\DEV, but that doesn't

work yet.

3297. ICD sofware problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-15 00:58:24 UTC
From: shenson@nyx.cs.du.edu
Message-ID: <1993Jun15.005824.3162@mnemosyne.cs.du.edu>
Source record: 38048

I wonder if anyone can help with some problems I'm having with ICD software;
the particular version I'm using is icdboot 6.06 but I've tried earlier versions
too with similar results. This is solely for the benefit of Minixfs.
The problem is using Rwabs with the extra long parameter in physical
mode. On my setup (Seagate ST277N with ICD adapter board) attempting to read
certain physical sectors (all above 0xffff) causes the software to read in
far too many sectors (though at the correct start point) if the cache is on.
With the cache off everything is as would be expected. This means that to use
some of the features of Minixfs pl4+ (e.g. huge partitions) the cache must be
switched permanently off; whereas this doesn't unduly affect minixfs
(particularly pl5 which is under construction) it slows down GEMDOS partitions
enormously.
Another problem relates to the pun_info structure; it appears to be
different for ICD; I've made educated guesses as to what it means but I'd like
something definitive.
Downloading later versions of ICD software from their BBS, here in the
UK would cost a fortune in phone bills so I rely on the versions placed on the
various archives. Also the UK company which supplied my hard disk/software
collapsed a while ago. Email to the ICD address in the docs to 6.06 has yet to
receive a reply.
I'd like Minixfs to work with ICD software since I have used it for some
time; but it appears to be so buggy I'll have to advise potential users to
either leave the cache off permanently or use other software which doesn't
suffer in this way.
Please respond via email if possible to shenson@nyx.cs.du.edu .
Steve.

3298. HSC pl30 MiNTlibs correction

What errors? I've received no bug reports about string.h. Could you give more detail?

>i'll try again when i get MiNTINC30.

Never mix and match patchlevels of the library and headers. They come in matched pairs and random combinations are guaranteed to not work.

>I used Turbo C (1.1) to build genmagic without problems.
>
>I can't build asmtrans because of a missing ___main, well,
>gcc242.txt said i should bind a dummy ___main to fix this, which
>i did.
>The same thing with mint.prg.

The MiNTlibs support gcc 2.4.2 as of PL 31, which is available as SOURCE CODE ONLY on atari.archive. PL 32 will be out tuesday or wednesday and will have binaries with it.

>After that, i copied everything to my auto folder, moved mint.prg to

>
>MiNT came up with copyright message saying it is a multitos kernel,
>which it isn't, because i commented -dmutitos. After that
>nothing happens (I asume MiNT is looking for multitos).

MiNT is probably very, very crashed at this point, due to the fact that PL 30 of the mintlibs do not support GCC 2.4.2.

Cheers,
entropy

3301. Cleveland Free-Net Atari SIG needs Programming/Developing SysOp

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-15 03:24:00 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <1vjfch$4vq@usenet.INS.CWRU.Edu>
Source record: 38057

The Cleveland Free-Net Atari SIG is in need of a 16/32-bit computers Programming/Developing SysOp.

This is a volunteer position. If you enjoy programming and hardware hacking with the ST,TT,Falcon030, etc. then this position would be great for you.

There is a Programming/Developing Forum within the 16/32-Bit Computers Forum on the Cleveland Free-Net Atari SIG. But, the Atari SIG is in need of someone to take it over and do something positive with it.

The qualifications are:

Must know some programming languages.
Must understand the inner workings of the Atari ST computer.

Must have time (at least 6 hours a week).

Must not give-up. If the Programming/Developing Forum is a little slow, many people would just give up on it. You cannot. Eventually if you work at it, it will be a great place for all programmers and hardware hackers.

Must enjoy conversing with other people.

Must have patience. There will be many Atari owners that are just learning about their computers. Some of the questions asked may be trivial, but the only way that they will be able to learn is by asking.

Must have dedication. We are looking for someone that will be around for the long-term (longer than 6 months).

If you are interested, your main duties will be to get the Programming/Developing Forum going. We would eventually like to see a FAQ list, source code library, etc.

Maybe _YOU_ can help get a place started where programmers and developers can meet, discuss things, and obtain information from.

Contact the Atari SIG (xx004@cleveland.freenet.edu).

We would prefer that you already have an ID on Free-Net.

Also, if you know programming, but not developing, or vice-versa, please reply as well. We might be willing to have TWO SysOps.

Thanks.

Sincerely,

Len Stys

3302. Wanted info on 68030 accelerators for the Atari ST and Mega ST

Newsgroup: comp.sys.atari.st.tech

Hi,
does anybody know why MultiTOS(V1.04) crashs down by calling BCONIN(3)?
Former versions didn't !

Bye Michael

3304. .o file conversion (GST,DRI) <=> UNIX/GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-15 08:33:55 UTC
From: steve@wan.inf.rl.ac.uk
Message-ID: <13672@hardy.rl.ac.uk>
Source record: 38055

Are there any tools out there to convert between object file formats?
I'm trying to compile a program that's part ANSI C and part 68k asm (moto syntax)
using GCC & Devpak but GCC only supports UNIX object files while Devpak only supports
DRI and GST object files. And of couse GAS uses MIT syntax and isn't really
suitable for handcoded asm anyway. Any ideas most welcome.

Steven

>game that involves animation, is a silly idea.

AHEM! Make that "a real-time game" - GEM NetHack runs in a window! (3 actually)
then I absolutely agree with everything you said. Real-time applications
suffer enormously in an windowing environment (ever seen how flickery X11
games run - especially on slower screens?).

Of course, this doesn't mean games cannot be MTOS friendly to a degree.
For example, in McMinos (recently uploaded to a.a - works on my ST but
not my TT), they have a "Desktop" button which brings up the desktop from
which McMinos was run. This allows the user to leave McMinos in memory
and run other applications. It may or may not multitask though - I can't
test that, because that would require MTOS.

Source record: 38060

In <1993Jun8.145641.1800@st-andrews.ac.uk> Giles M.W. Guthrie writes:
> Does anyone know how to perform a **soft** reset in a C program? ...

Resetting an 68000: the address of the reset routine (the one that
runs when you reset the computer) is stored at address 4.
In assembly the code would look like this:
move.l 4,a0 ; load the address of the reset routine
jmp (a0) ; and jump into it
Some C compilers allow you to put assembly instructions directly into the
C source, but address 4 is in a protected part of the memory.
Here is a little routine that should work with all C compilers.

```
void do_reset(void)
{
unsigned int resetcode[3] = {0x2078, 0x0004, 0x4ED0};
/* These are the assembly instructions above */
(void)xbios(38, (long)resetcode);
/* (void)Supexec((long)resetcode); might also work */
}
```

This routine performs a soft reset.
A hard reset is performed when you wipe out "memvalid" ($420).
The assembly instruction would be: clr.l $420
In the C routine, alter resetcode to the following:
unsigned int resetcode[5] = {0x42B8, 0x0420, 0x2078, 0x0004, 0x4ED0 };
This performs a hard reset.

```
In a previous article <marco@sys6626.bison.mb.ca> (John Perry) writes:
> I want to send a keyboard event message using the appl_write() function.
> Is this possible?

No, it isn't. You might want to try appl_tplay(), though.
Here's an expample in C.

/* Assuming appl_init() and other stuff */
char buf[8];

buf[0]=buf[1]=buf[2]=0;
buf[3]=3; /* 0=timer, 1=mouse-button, 2=mouse-move, 3=keyboard */
buf[4]=scancode; /* Put the scancode you want to send here */
buf[5]=ascii; /* Put the ASCII code you want to send here */
buf[6]=0;
buf[7]=kbstat; /* RShift=1, LShift=2, Ctrl=4, Alt=8 */
appl_tplay(buf,1,100);

Note. This only sends a keyboard EVENT. It is not put in the keyboard
buffer (you can't get the key with Gemdos/Bios functions).

C will allow you to case an integer to a pointer, so no assembler is needed:

(*(void (*)() 4))();

This casts 4 to a pointer to a void function taking no arguments
(void (*)() 4))
and
(* ...)()
de-references the pointer and calls it.

So a nice declaration would be

#define reset (*(void (*)() 4)

and you can write
reset();

>A hard reset is performed when you wipe out "memvalid" ($420).
>The assembly instruction would be: clr.l $420

>This performs a hard reset.

Further you can cast an integer to a pointer to something; so

*((long *)0x420) = 0;

or
#define memvalid (*((long *)0x420))

memvalid = 0;
reset();

Source record: 38068

> No, the 68030 is executing always one instruction per cpu cycle.

Well, not exactly. There are many instructions that take more than one cycle to execute under even the most ideal conditions. (MUL and DIV for example.)

Also, there is a lot of overlap in instruction processing due to the pipelining. While the cpu is executing the curent instruction, say an ADD, it can also be doing effective address calculations for the source operand of the next instruction. It's a matter of semantics, but I think it's fair to say this constitutes executing more than one instruction at a time, in all but the most formal sense.

> [C code to rest machine]

It can be even easier than that asm-code-in-an-array stuff. For an ANSI
compiler, code like this should do it:

void do_reset(void)
{
long (*reset)(void) = 0x0004;
Supexec(reset);
}

For a non-ANSI compiler, just declare long (*reset)() = 0x0004; instead.
If you're really a minimalist, do it like this:

Supexec((long (*)(void))0x0004);

For a non-ANSI compiler, the extreme minimalist version is simply:

Supexec(4L);

Which you've got to admit is pretty short and simple. :-)

> [DRI/GST/Unix object format, MIT/Motorola assembler syntax, getting them
> to work together]

The new version of the JAS assembler from the HSC compiler package can read Motorola-syntax assembler and emit either DRI, GST, or Unix a.out type object modules. This is part of the HSC 2.0 package, which is currently in beta testing, but I can email you just the new JAS if you're interested in trying it to see if it solves your problems.

The major limitations in JAS are that it supports *only* 68000 instructions and addressing modes; no 680x0 stuff and no 6888x stuff. And no macros. Email me if you're interested.

From: marco@sys6626.bison.mb.ca
Message-ID: <gw375B1w165w@sys6626.bison.mb.ca>
Source record: 38073

I have an ACC which I want to wait in the background for a certain amount of time, and then perform a function. What's the best way to have it come out of the background after this specified period of time?

I had thought I would just have it check to see if the correct amount of time had elapsed after every keyboard event, or something like that, but the ACC seems to only get an event message when it is selected from the Desk menu.

Thanks in advance.

But you _are_ right as I learned from a communication from jean-marc zucconi (jzucconi@nyx.cs.du.edu). The key thing is to set this (AES) PATH up at boot-time (there is a tiny AUTO-folder utility ENVIRON.PRG that does this task admirably).

Then when you enter the GULAM shell you set the (GULAM) PATH as normal (NO semicolons etc. here). The point is that when you execute a GEM program with (for example)

gem DEGELITE

then DEGELITE.PRG will look for DEGELITE.RSC in the directories listed in the (AES) PATH you pre-defined at boot-time.

Hence, there is now NO NEED to pushd to the directory of the GEM program (unless it is desirable to do so for other reasons). And, of course, it also makes sense to put all your .RSC files into a common directory such as D:\RSC\ and be sure to include this in your (AES) PATH.

I've been using GULAM for years - and I'm very glad to have learnt this - it will certainly change the way I access GEM programs that have RSC files. Of course - the best-written GEM progs have their Resources built-in and this question does not come up for them.

Hope this is useful to the originator of this debate,
W. Alan B. Evans

This will not work for it will try to execute a (nonexistent) routine begining at 0x4L - instead of begining at the VECTOR that resides at address 0x4L. However, the (minimal?) line

```
Supexec(*(long *)0x4L);
```

will work on Mark Williams C (which I guess these days is called a Non-ANSI Compiler though in Version 3.0.9 (the last) they did make an effort to conform with some ANSI conventions - presumably those they agreed with!!) and (of course!) Sozobon C (is it fully ANSI these days?).

This is for a warm boot ONLY. If you wish to cold boot, you must first enter Supervisor mode to _firstly_ put MEMVALID ((*(long *)0x420L)) to zero. i.e. something like

```
#include <osbind.h>

I take it this is v0.55 minixfs. Try 0.60 pl2 on atari.archive as mfs602b1.zoo
(binaries only) or compile up 0.60 pl4. Be warned though these are pre-alpha.
Steve.

NO!! Don't use Setscreen. The BEST way is to use the VDI routines but probably isn't gonna work for an action game, so you'll have to make an assumption on how screen memory is laid out based on what you know of the machine and how is returned in the VDI work_out array.

Then you malloc() the memory you need for your images and write into the blocks and make MFDB headers for them so you can use vro_cpyfm() to actually move this data into the window (while walking the rectangles).

If this sounds hard or confusing, well, it is. The best way is to make a small window on the screen with a close box and full box. Inside you just put the name and copywrite info for your game and use the VDI to write that data. The close box ends your game. The full box is used to get out of the windowed "pause mode" and into the game. When the full box is pressed, call wind_update() to stop GEM from writing to the screen then do your Setscreen() hacks to get the game running. This is better because Setscreen will put you in a resolution your game can deal with instead of trying to deal with the resolution GEM is in. Provide a "pause" feature to return to the window mode and don't steal too many vectors (if you steal any at all, be VERY careful and restore them before back to the window - you then release wind_update() so GEM can let the user play with the other windows.

This is likely a MUCH better method.

T

3324. Multisync monitors

Hello,

I left a note earlier about Multisync monitors. I found what might work, but I want some input from others, if you have one, or know about it. I can get a NEC 2A for $349. Will this work for me?? Otherwise, what others brands and models might I look at. I have tried calling many companies, and none of them say that there monitors work on the Atari. Please help me out here, thanks a lot.

the GEM function evnt_timer will do this for you.
evnt_timer returns when the amount of time has run out.
I have programmed this in an ACC-Clock that prints the actual time, every
second in the right corner of the desktop.
but this will only work correctly with no ACC-extender loaded.

Wait for a timer event using evnt_multi -- you specify the time to wait in milliseconds. You're not guaranteed to be scheduled *exactly* when the delay expires, but this is still the easiest method.

With the multisync monitors all I think (I'm not certain on this) you need is scan rate of 15kHz and about 22kHz for high res. I've got a NEC xl multisync 19' monitor which will only work in high res mode on my STe , the reason is that the XL minimium scan rate is 20kHz.I think the smaller NEC monitors can got down to lower scan rates.

But isn't it necessary to do an evnt_multi to catch the AC_OPEN and
AC_CLOSE events too?
Oh and by the way I would like to thank all people that explained to me
how to use ACC's and RSC's. My idea was to have an Extend-O-Clock. It
would just load different backdrops for it Clock window upon receiving
a Change_backdrop message from the selector application. I might
program it for MultiTOS one day, but at the moment I can only use the
program from the normal desktop. If I use Teradesk it will come once,
but won't return after I have closed it. Pretty strange uh? Seems that
the internal resource got deallocated or something.

>your earlier posts... I may be wrong though

Yes, correct. It currently needs a backend in order to produce
native object code. The back end "is not expected to do anything else"
because we have already done syntax and error checking, etc.
The first official backend will be Lattice. Others will follow
as they are capable.

> Also - what benefits does Comeau C++ have over GNU C - taking into
>account the price difference :^>

Well, for starters, I can at least semi-validly argue that there is no
price difference... at least not the one you are thinging of ;-) in all cases.
Second, I mention some others above: robust, up-to-date, multi-platformed.
There is free shipping and handling (domestically). Free technical support
(amongst a plethora of electronic mechanisms (including our BIX vendor
support conference).

One must note that as every C++ vendor is targeting AT&T USL cfront 3.0
specification and implementation, that we literally are cfront 3.0 (we
are source code licensees).

The cost of Comeau C++ 3.0 With Templates for the Atari will be $250.
Re student discounts, I am sorry to say that the only way for us to do
that is to raise our price and leave the $250 as the student price.
(Being that Comeau C++ is licensed from AT&T USL C++, we've got a
bunch of license fees and royalties to accomodate, and at $250,
little is left to discount on).

Many of the Amiga details are similar to the Atari details, does it make
sense for me to post those details?

>And how much does it rely on Lattice C specifics. Can it be used with
>another C compiler?

The initial release will only have official support for Lattice C.
Other back ends will officially be added as time goes on. Folks
may find they can use the other back ends themselves, but we needed
to start from somewhere.

One does not. I suppose the idea (if any) is that the high-end machines
will be fast enough to
do graphics without the Setscreen() hack. Very simple examples even work on
an 8 mhz machine (sprites such as the mouse which are done during vblank).
Unfortunately, that's a privilege of the AES, because as far as I know
you're not allowed to use GEM calls during Vblank time (but I'm not sure
about this), and it should be clear that you must use GEM functions for
all your graphics (this is part of what "in a window" means).

Maybe the statement ``Games should run in a window'' should be interpreted
as: ``the only good game is chess'' or similar.

This doesn't solve the problem that other applications slow down the system.
As long as they don't use the GEM screen (they could be running on a terminal)
they are free to take up 90% of the processor time. I think it should be
accepted that on a multitasking box playing games means shutting down most
of the applications running. But then again doesn't Xtetris usually run
fine? OK, it's a simple game, but it's got ``animation''.

3336. ST sound...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-16 15:36:22 UTC
From: lancer@starbird.WPI.EDU
Message-ID: <LANCER.93Jun16153622@starbird.WPI.EDU>
Source record: 37994

I gather that the ST uses a Yamaha sound chip. Can anyone tell me more about this? Apparently it produces 3-channel sound which is mixed down to one channel for the monitor speaker. This leads me to wonder how difficult it would be to separate those channels into a stereo pair and leave the third (or maybe the mix) to go to the monitor for keyclicks or warning beeps...

How easy would it be to do this? Can I just find the correct trace and solder on a wire to carry out two of the channels? Would they be standard line level? Am I hoping for too much? Do these three channels really contain separate information at all or are they just redundant?

Also, can someone tell me more about the Tweety board? I have heard it is an add-on which gives an ST stereo sound. Was it a commercial product or just a modification similar to what I suggested above?

Please post or email... Thanks!

The NEC2A isn't suitable for an ST/E. You might use it with the TT or Falcon030. But if you want to upgrade to a Screen-Enhancer (Screen-Wonder [might be dead], Screen-Blaster or BlowUP030) you should get a very good SVGA or better a multiscan with a variable frequency of 30-50kHz (even better if the range is wider).

>> [my comments on making a game run fullscreen in an MTOS-friendly way]
> This doesn't solve the problem that other applications slow the system down.

Perhaps you missed a line in my posting: "You're gonna have enough trouble with MultiTOS making your system run so slow that the game will be unplayable as it is..."

I didn't make a big deal of the issue, just that one line. That's because y'all would soon tire of hearing me flame MultiTOS on this point. (Some of you surely have reached that point already.)

If there's a way, a good way, to solve this problem, I don't know what it is. You can run your program in supervisor mode, preventing MTOS from giving cycles to other tasks. That DOESN'T qualify as a 'good' way to me.

Eric Smith (and the rest of Atari), if you're listening:

MultiTOS NEEDS A WAY FOR AN APPLICATION TO HOG THE MACHINE!

I picture an appl_exclusive() call with a TRUE/FALSE parm. When you call it with TRUE, that tells MTOS that you are entering a real-time piece of code that needs the machine all to itself until further notice, and that might be a good long time.

There are some who might say that programs that want to do this aren't being good citizens of the multitasking world. Well, if you don't like programs that do that, you don't have to run them. On the other hand, there are some programs that can, by their very nature, only work properly in such a mode. If a user feels compelled to use such programs, then right now that user has to constantly reboot, without MTOS to use some programs, then with MTOS to use other programs. It won't be long before such users realize that with all the rebooting MTOS isn't doing them much good at all, and they'll just punt it.

Cyber Paint is a good example of such a real-time program. When I run it under MTOS, and it is the only application running, it runs too slow to be usable. When you're drawing, you can drag the mouse around as if to paint a circle. What you get is a thing like a stop sign, because MTOS is stealing so many cycles that Cyber Paint can't track the mouse smoothly. Animation playback is a joke under MTOS. And, the palette changes that Cyber Paint does on the fly when the menus are up doesn't work at all; MTOS steals way too many cycles for hblank processing to get the palette changes done in the time-critical way it needs.

Full-screen animation painting and playback is not the sort of thing that lends itself to running in-a-window using only VDI calls. I've done everything I can to make the program work well under MTOS, and still MTOS

gets in the way so much that the program is unusable.

JUST GIVE US A WAY! Let us inform MTOS that we're taking over the machine, going fullscreen, locking out GEM events with wind_update(), and until further notice, no time slicing or dispatching of other tasks is to happen. You give us this, and in return we'll give you our side of the compromise: our full-screen machine-hogging applications will provide the user with a way to suspend the fullscreen nature of the program, then we'll restore the screen resolution, put up a GEM menu bar, and let the user access other applications while we're suspended.

This way, the users get the best of both worlds: they can use real-time software such as games and animation programs that require realtime response, and they can also use applications that lend themselves to windowed operations. And they'll be able to do it with constantly loading and unloading multitos.

```
>> PATH= for GEM programs
> Use ENIRON.PRG in the auto folder

I'd like to suggest that you consider GEMENV.PRG rather than ENVIRON.
The main thing it has going for it is that it has a builtin GEM editor to
change the env var values, and you can change them at any time, even when
the system is running. (When run from the auto folder, it installs itself
as resident, using under 1k of memory. When run later, it brings up the
editor dialog.)

Look for GEMENV11.LZH at a.a (in the Programming directory, I think).

3341. 50 Hz monitor glitch

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-16 17:40:13 UTC
From: vicb@clark.edu
Message-ID: <1993Jun16.174013.22495@clark.edu>
Source record: 37996

When I do anything with the monitor speed set to 50 Hz, the top 1/5th or so of my display becomes stretched in appearance, with the distances between single pixels (vertically speaking) looking more like two or three with black space in between them.

Is this a problem with my individual monitor, or is it common to all American (60 Hz) monitors? (this is a regular SC1224, bought in '86)

Is there anything I can do to fix it? I would like my program to run using 50 Hz, and would like to know if this phenomenon will be present on every machine that it is run on.

Thanks for any help.

Victor Bruhn
vicb@clark.edu

>ideas? I tried grounding it (the system reset), I tried connecting it

Grounding the MD line is right - the ST will reboot when the state of the mono detect line is changed.

Monitors capable of the ST's high res ground the pin, others ("color monitors") don't.

No. argv[0] is only filled in if your program is launched from a shell that follows one of the ARGV standards (ha!) and if your program was compiled with a library that recognizes the standard.

Since your accessory is not launched by a shell, it cannot get its name in this way, even if it is linked with a runtime startup that recognizes the ARGV mechanism.

What you should do is require that the file name have some fixed part (e.g. "FOLDR") and then do an Fsfirst/Fsnext search for a matching pattern (e.g. "FOLDR*.*") When you get a match, that's (hopefully) your program, and you can then examine its name and get your parameter.

Cheers,
entropy

Is there a program that can re-direct the normal sound to the TT's Stereo output ??

I would be very very interested in this if one exists.

If anyone knows please respond I have yet anyone respond to my queries here.

Thanks, Scott

3347. Trouble with unix-style a.out object modules

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-16 22:01:22 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Jun16.220122.744@mnemosyne.cs.du.edu>
Source record: 37998

I recently modified HSC's JAS assembler to output a.out style object modules. I used the manpage for a.out I found here on Nyx, and some source code for a program called DRI2GNU that I found at a.a. Now I've discovered that it doesn't seem to work quite right.

I've got (I think) two basic problems. One is in handling BSS-segment symbols, and the other in handling absolute segment-based relocations.

I found (in DRI2GNU) that data-based symbols have a value which is not their offset relative to the start of the data segment, but rather relative to the start of the text segment. But, BSS symbols (in DRI2GNU) were relative to the start of the bss segment, not relative to the start of the text segment. Now I'm wondering if this is wrong. In a program that contains references to BSS symbols, I'm finding that the symbols (at runtime, as shown by a debugger) seem to be in the data segment. Since this is flat wrong, data is getting overwritten causing crashes.

So, when creating BSS symbols in an object module, should I be setting the symbol's value as the offset from the start of the text segment?

The relocation problem is harder for me to put into words right now; I think I need to do more work on it first. I have tried, BTW, looking at the source code to GNU LD. But, as usual, there's so much conditional code in there to handle various systems that you can't really tell what the damn thing is doing.

Silicon Graphics' Indigo and Indigo2 workstations also have 56001 DSPs in them. And they're still being built (unlike NeXT). We've recently reduced the price on the original Indigo wo it's a pretty good deal these days. It's not in the Falcon price range though.

One thing the Amiga Freeks will not own up to, is that all there Disk data
storage is ONLY checked by SUM checking, the same checking that was used
with the First Xmodem, its like playing Russian roulette with your disk data...

Also they have to slow there drives down (150rpm) to to read/write HD disks..

There are some of the thinks we had to put up with some 10/20 years ago, not
now with a modern computer...

Well, that's what timer events are for! See the evnt_timer() or
evnt_multi() documentation for details. Note that using this
approach, your ACC will only be scheduled if the main application
is a GEM program (standard TOS behaviour; MultiTOS fixes this).

Actually, you *can* get the name using shel_read(). But PLEASE do this only in accessories (in applications: first try argv[0]!!!!).

```

I'm not sure you can return the timer like that. I don't think Supexec is guaranteed to preserve D0. A more reliable way to do it is to save the value in some variable, e.g.:

```
long _timer;
void _gettimer(void)
{
_timer = *(long *)0x4ba;
}

long gettimer(void)
{
Supexec(_gettimer());
return(_timer);
}

int main(void)
{
long timer;

timer = gettimer();
return(0);
}
```

Supexec() is guaranteed to preserve d0 (the LONG return value from Supexec
is the value of d0 returned by the called function).

I second this, whilst I've not actually done any '030 programming as yet, I've read the Motorola manuals on the '030 and there it is pointed out that attempting to count cycles is hard at best and impossible in some cases. The only thing you can do is estimate a maximum and minimum number of cyles that an instruction can 'effectively take', indeed this is the very form of instruction timing that Motorola give in their manual. I can't remember precise details off-hand, but you could have a MOVE.W instruction taking from 0 to 4 cycles for example. As was pointed out in the previous posting this all depends on the type of instructions that follow one another (there is a high degree of parallelism in the chip architecture if I remember rightly) and also cache hits etc.

Suffice to say that gone are the days of saying 'and this code will take exactly 68 cycles to run......'

ScreenBlaster and BlowUP030 are Falcon Specific products. With a MegaST the cheapest way to extend resolution is AutoSwitch Overscan (price in the UK is 40 pounds). Whatever the product, you always have access to the standadrd resolutions.

It doesn't even work on a 68000. Because the 68000 already has an
instuction-prefetch, as someone in comp.sys.m68k stated recently.
Haven't checked it yet, though.

: Haven't checked it yet, though.

You are of course right about the code not working on a 68000.
It was a major mistake from me. My only apology is that it was
at least a millenium since I last wrote any code relying on the
pre-fetch mechanism in the 68000. Anyway, after looking through
some old code I came up with this (which DOES work, I've tested
it :-):

```
**********
moveq #0,d0
move.w #$4e71,fool
fool move.w #$4e71,d0
cmp.w #$4e71,d0
beq anywhere

Here execution continues if you have single-stepped through
the code.

anywhere:

Here execution continues in "normal" cases!
**********
```

For anyone who knows his way around a debugger and knows that #$4e71
is a NOP-instruction this is really simple to spot. However, it can
be made a bit more complex by manipulating both bits who already have
been fetched and ones who haven't.

I have some sample code that I could show you, but the problem is that it's
a little difficult to understand the code unless you have some underlying
knowledge of data compression. (like Huffman encoding which is not very
obvious.)

I would first recommend that you read the newsgroup comp.compression and
comp.compression.research. Be sure to get the FAQ--there is a small
introduction to data compression in the FAQ which is enough to get you
started.

There is a free data compression archive called AR002 which is used in
Zoo and Lharc that is available on FTP sites. Use Archie to find it.
Believe me, though, this code is _difficult_ to understand--I still
don't understand it completely.

Finally, a very good introductory book on data compression is
"The Data Compression Book" by Mark Nelson (M&T books, ISBN 1-55851-214-4)
It concentrates on lossless data compression, and is very easy to
understand.

Hope this helps.

Desmond

I have four hard drives on my Supra adapter;three SCSI & one old ST406/512
(via an Adaptec controller). Only three of these were "supported", ie only the
Seagate ST157 was present on the format menu. They all work o.k though.
The only problem I ever came across were the parity & start/stop jumpers.
You have to be able to disable parity on your drive.

I just formatted the drives using data from either the drive itself (labels) or
by using other models from the same manufacturer.
I don't know if this is the best way to do it, but it worked for me...

As I remember it, it isn't g'teed in so many words in the docs. But, it has been doing so since day 1. The docs prototype it as a void function, but Lattice C (and others) prototype it as returning a longword. If Atari ever changes it to lose the called function's return value, I think a lot of things will die, and they'll realize that and change it back fast. :-)

> troubles with a.out object modules

As a followup to my own posting, I figured out the answers. (Symbol values for BSS symbols are relative to the start of the text segment, not the BSS segment.) I also figured out my relocation problems. (The words to be relocated in the text/data segments for absolute segment-based relocs already contain the offset from the start of the text segment to the referenced symbol, unlike DRI/GST format.)

The upshot of all this is that the DRI2GNU program at a.a is definitely buggy. It handles both BSS-based symbols and absolute segment-based relocs improperly. I hope to write a GST2GNU (which will handle both DRI and GST input) fairly soon, but I've got HSC and GemFast bugs to fix first.

3369. Re: Can I get my accessory's name with *arg

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-17 17:19:53 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Jun17.171953.5713@mnemosyne.cs.du.edu>
Source record: 38019

>Actually, you *can* get the name using shel_read(). But PLEASE do this
>only in accessories (in applications: first try argv[0]!!!!).

The only problem with shel_read() in applications is that many shells
don't put valid data into the buffer used by shel_read(). I found a
workaround for this to allow shells to behave properly, and Atari has just
published it as a formal "good thing to do".

The workaround is simple: if you're running under MultiTOS, use
shel_write() to start an application instead of using Pexec(). If you're
on an older version of TOS, do it like this:

```
shel_write(1,1,1,full_program_name_and_path, command_line_image);
Pexec(0, full_program_name_and_path, command_line_image, NULL);
shel_write(0,1,1,"","");
```

The shel_write(1,...) says "when this application ends, run the named
application." The Pexec() then runs the named application right away.
The shel_write(0,...) then says "when this application ends, don't run
anything" which effectively cancels the first shel_write().

While the spawned program is running, it can properly use shel_read() to
find its name and startup path, because the shel_write(1,) has put the
info into the AES buffer for it.

Properly conforming GEM applications use shel_read(), they don't rely on
ARGV. This has to be so, because the desktop still (even under TOS 4.02)
doesn't pass args via the ARGV standard. So shells with use this simple
shel_write() workaround will help properly-written GEM program work right.

3372. 14.4K Fax/Modems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-17 20:51:34 UTC
From: dunham@src.honeywell.com
Message-ID: <1993Jun17.205134.26367@src.honeywell.com>
Source record: 38021

I just bought a Zoom 14.4K Fax/modem, supporting V.32bis, V.42bis, MNP 4 & 5. I have an STE with TOS 1.6, and currently use FLASH. I'm rather new to this hi-speed stuff, and I have few questions:

1. Can FLASH, or the STE, truely utilize the speed of this modem?
2. Can I always remain connected to the modem at 19200, and will the modem always auto-negotiate to the other modem correctly?
3. Any other recommended telecomm programs?
4. Does the hardware flow work without a "serial fix"?
5. Do things get "confused" if SERIALFX.PRG resides in the AUTO folder, and the MODEM.CPX is resident with it's _own_ settings, and SERIALFX.CPX has "locked" the handshaking on, and then I run FLASH?
5. I have SERIALFX.PRG -- is this enough? Any better solutions?
7. Do I need a special RS-232 cable to utilize the hardware flow control? (Apparently Macintoshes do).
8. Regarding FAXing, are there any PD programs available via ftp for the ST?
9. Are there any docs available via ftp that can clarify this whole mess?!!

Thanks,
Scott

From: dunham@src.honeywell.com
Message-ID: <1993Jun17.224431.5745@src.honeywell.com>
Source record: 38022

I'm discovering that after connecting at 14.4K with error correction, if I read a long continuous flow of text, eventually it becomes riddled with errors, almost as if a buffer were full and the highspeed flow control was not working... Anyone recognize this type of behavior? (I'm running the Zoom modem on an STE with TOS 1.6 using FLASH)

Any help would be most appreciated!

Scott

I had this problem on my TT with STalker, and I fixed it by changing my
serial buffer size to 8K. I don't know if you can do that on a PC, but
STalker comes with a nifty little program called auxinit that you stick in
your auto folder that can increase it to anything up to 20K I believe...

Connect (German Shareware, Exellent!).
|> 4. Does the hardware flow work without a "serial fix"?
No.
|> 5. Do things get "confused" if SERIALFX.PRG resides in the AUTO folder, and
|> the MODEM.CPX is resident with it's _own_ settings, and SERIALFX.CPX has
|> "locked" the handshaking on, and then I run FLASH?
Better use HSMODEM1.
|> 5. I have SERIALFX.PRG -- is this enough? Any better solutions?
HSMODEM1 replaces the whole serial routines, then they will work very good and fast.
|> 7. Do I need a special RS-232 cable to utilize the hardware flow control?
|> (Apparently Macintoshes do).
A three-wire cable is not enough! A normal cable from the store should do the job.
|> 8. Regarding FAXing, are there any PD programs available via ftp for the ST?
Yes, Hackfax 1.10 (German Freeware, but only for ZyXEL, sorry!)
|> 9. Are there any docs available via ftp that can clarify this whole mess?!!
I don't know.

Scott, never use Xon/Xoff flow control, it must be RTS/CTS..

There is a very simple way to test your flow control, with out connecting to a BBS or any thing..

Have Flash running and with that patch that I was on about, put the Modem into analog loop/back...

Select file upload, select a small/large text file that you know, send it, then look at the capture buffer, also you should see the data going out in blocks, these blocks are the Modem buffer filling up and then being sent..

But you must have a bit of room in the capture buffer to do this..

Roger..... sheppard_r@kosmos.wcc.govt.nz

To a point, port speed of only 19.2k pbs..

>2. Can I always remain connected to the modem at 19200, and will the modem
> always auto-negotiate to the other modem correctly?

Yes....

>3. Any other recommended telecomm programs?
>4. Does the hardware flow work without a "serial fix"?

But get SERIALFX 2...

>5. Do things get "confused" if SERIALFX.PRG resides in the AUTO folder, and
> the MODEM.CPX is resident with it's _own_ settings, and SERIALFX.CPX has
> "locked" the handshaking on, and then I run FLASH?

Scott, there is a Patch program for Flash 1.6 as it does not use Flow Control at all, this also helps that you don't have to use the CPX program..

A German chap I think told me that there was a better Flow control fix patch program for Flash, it even lets you use the Midi ports, but I never got the name from him..

If he does read this Please let us know were this can be got from..!!

The patch for flash was in HS fix or HS232 or some file like that, I could still have it around...

>5. I have SERIALFX.PRG -- is this enough? Any better solutions?

Some one posted HS Fix 4 or some thing like that here a few weeks back..

>7. Do I need a special RS-232 cable to utilize the hardware flow control?

Just curious... but WHAT ON EARTH do you need to do THAT for?
I have always thought of the 68k series as being nice and high
level (at least at a higher level than C64 Basic V2 which I was
used to until I started working with STs).

Arg! This is why I wrote: "in applications: first try argv[0]". This means:
if you've got argv[0] via ARGV, use it!!! This way, you won't miss argv[0]
when it has been passed by the method that's been supported since 1989.

Note that the workaround you mentioned has a big problem when used in TOS 1.00
and TOS 1.02: you can't invalidate the buffer, so you'll have to start *some*
other application when you leave the shell.

However, some (mostly German) software will support the AV_KEY (or was is
VA_KEY) messages which Gemini uses [It's AV, because it was designed for
accessories to send a key `back' to Gemini when they can't do anything with
it].

3386. CD_ROM metados HELP !

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-18 12:22:42 UTC
From: mjw@crosfield.co.uk
Message-ID: <1993Jun18.122242.16459@crosfield.co.uk>
Source record: 38039

HELP PLEASE ....

I am having some problems getting a CD rom to work on my ST with metados2.

The system looks like :

520 STM with 4 Meg ram
Tos 1.4
170 Meg Hard disk on host adaptor as device 0. (this works fine !!)
CD_Rom on same host adaptor as device 1
AHDI (HDX5.0 driver)

When the system powers up the driver reads the devices on the bus and reports

UNIT 0 Fujitsu drive
UNIT 1 CD_Rom
UNIT 2 Not Responding

As expected and the light flicks on the CD_Rom.

When the metados2 program in the auto folder runs (it is the only thing in
there apart from the CD drivers and the config file) it reports that :-

```
************************************
Atari MetaDOS RMS,RJZ
Version 2.0 01/01/91
Copyright Atari Corporation 1990 1991
************************************
CDAR-Audio ROM ACSI/SCSI BOS v2.0 installed as Y: on DMA 1.
HSG May'86 v1.9 driver installed as I:.
ISO9660F v1.9 driver installed as J:.
************************************
```

At this point the light on the CD Rom flicks again.

O.K. Now with the desktop up, install a desktop icon for I and J.

Now click on either icon ......

Well the system says that the device is NOT RESPONDING and the light on the CD
Rom does NOT come on ????

Any ideas on what the problem is please ????????

Note that any DMA number other that 1 does not make the light on the CD
Rom flick when metados2 is run, any SCSI id reports a BOS error: device not
responding and fails to install so 1 does seem right.

The config file follows ......

```
; Config.sys An ascii file that describes the system configuration.
;
; Physical Bacic operating system format
; *BOS, [Physical Bos driver][Arguments], [Physical id]:[DMA channel], ...
; Device # meaning
; 0 - 7 DMA device 0 - 7
; 8 - 15 SCSI device 0 - 7
;
;
; *BOS, C:\AUTO\CDAR.BOS, Z:0
*BOS, C:\AUTO\CDARGEN.BOS, Y:1
; *BOS, C:\AUTO\NETBIO.BOS, X:7
;
; Logical DOS format.
; *DOS [Logical DOS] [Arguments], [Logical id]:[physical id],...
;
*DOS, C:\AUTO\HSMAY86.DOS, I:Y
*DOS, C:\AUTO\ISO9660F.DOS, J:Y
;
; Load in the other "auto" folder files
;
```

Thanks in advance

I use HiSoft BASIC but know nothing about the laser printer so I guess all the LPRINT and bconout() do not work. He obviously needs to write to the DMA but I'm not sure how. You could mail Dave Nutkins who wrote the program at hisoft@cix.compulink.co.uk

Annius Groenink (avgroeni@cs.ruu.nl) wrote:
: Just curious... but WHAT ON EARTH do you need to do THAT for?

No particular reason. :-) In the beginning it was a way for
protection-writers to fool those who tried to hack the protection.
After it got widely known it almost disappeard and only showed
up in lamer-tests and such. :-)

: I have always thought of the 68k series as being nice and high
: level (at least at a higher level than C64 Basic V2 which I was
: used to until I started working with STs).

But it was kind of a challenge to use methods not known to the
general public. It was the same with the Z80 (Spectrum). It was
interesting to use all those `undocumented' instructions,
especially since some of them really speeded up some tasks. With
microcode all such options went away since there would never be
any `left-over' instructions in microcode-processors (as the 68k).
Instead of concentrating on undocumented processor-instructions
the interest was focused on the sourrunding chips and how to get
the most out of them. Just look at all fullscreens. :-)

As far as I know the Z80 was the last `real' processor who didn't
use microcode.

3390. argv question ?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-18 15:48:40 UTC
From: rahin@scs.leeds.ac.uk
Message-ID: <1993Jun18.154840.27322@gps.leeds.ac.uk>
Source record: 37894

The answer to this question is possibly very trivial. Nonetheless I am having trouble with it. I wrote a program like the one below and compiled it using Heat & Serve Sozobon C V1.40 and the dLibs library that came with this C implementation.

```
#include <stdio.h>
#include <stdlib.h>
#include <stddef.h>

void main(argc, argv)

int argc ;
char* argv[] ;
{
int i ;

printf("Number of arguments = %d\n", argc) ;

for(i = 0; i <= (argc - 1); i++)
{
printf("Argument %d = %s \n", i, argv[i]);
}
}
```

I am more interested to see the value of argv[0] in order to determine the source directory of the exceutable. The program however, did not return anything for argv[0]. I am not vary familiar with various XARG and other standards. The operating environment is TOS 1.0 and under Gulam. Could anyone shed any light on what's going wrong ?

Thanks in advance.

- Rahin (rahin@scs.leeds.ac.uk)

There are programs (for the ST) that count cycles by synching with the video beam, record its position, execute some code, and then check the beam's position again. Wouldn't that be able to measure 68030 instruction timings?

> Where?

In the current issue of the Atari RSC developer's newsletter. I provided
the workaround to them quite some time ago, and they just got around to
publishing it. I assume the long delay was because they were testing it
for compatibility with older TOS versions.

Unfortunately(?) no. You will of course be able to measure the timing,
but you will probably get different results each time you run the
program. The problem is that the number of clock-cycles a piece of
68030-code takes depends a LOT on the state of the data and instruction-
caches. If you can predict (and emulate) the exact state of the caches
you MIGHT be able to accurately measure the timing, but such a thing is
not trivial, and I even doubt it is possible at all. :-(

And if you want to count clock-cycles on a 68030 you must also
look at what kind of memory it will run from. The type of memory
will have a big impact on the timing especially if a memory-access
misses the cache. On a TT you might get away with running the code
from ST-memory which would give you exactly the same delay on all TTs
if the cache-state is equal (I _think_ so at least :-). However, if
you run the program from fastram you will definately run into problems
since not all TTRAM-cards are capable of bursmode access. Also, there's
a difference in speed between different fastram-cards...

Gulam will use the precursor to the ARGV standard if you use some configuration option (I haven't used Gulam in years but I think "set env_style=mwc" is the command). This is good enough for most normal uses since ARGV is pretty close to the Mark Williams C argument conventions.

Cheers,
entropy

3396. LOGICAL sectors (set of) ---> file

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-18 21:17:06 UTC
From: giggey@ecf.toronto.edu
Message-ID: <C8u5sJ.Ezn@ecf.toronto.edu>
Source record: 37898

This is a request for help!

I have used KNIFE to determine a certain number of sectors that I want to remove from my A: drive and place into a file onto my C: drive (for example.

This is because the floppy's boot and FAT were damaged beyond repair --but al least I know what the data looks like and about how long it should be.

I have found that it starts at LOGICAL sector 00017 and continues to about locical sector 00690 (decimal values). Using Knife, I have been unable to ascertain what sectors/tracks/sides these are [frustrating!].

Bearing this in mind, I feel that it would be far too tedious to 'build' a file (sector-by-sector) using KNIFE, and I am unaware of how to have KNIFE do this 'automatically'.

I have been trying to write a small assembly (but STOS or 'C' will also do) programme that will 'surgically copy these specific sectors to a file on my HD. But the problem is that I have run against a brick wall in the form of XBIOS call #8 (_floprd), which does not work with logical sectors.

I would appreciate any help to point me into the right direction for locigal sector's data retrieval.

Thanks in advance.

MIke

HSC 1.40 supports xArg and ARGV standards. Unfortunately, there's a bug in the xArg handling in 1.40. (But the good news is that, as far as I've heard, only the Gemini shell uses xArg.)

It could be that Gulam isn't passing the args via the ARGV standard. If this is the case, you're just plain out of luck. (The other way to determine the startup directory is via shel_read(), but it's almost a dead certainty that Gulam isn't smart enough to put the right info into the AES's buffer via shel_write() before it starts your program.)

>companies, and none of them say that there monitors work on the Atari.

Hi there!

Just have a look at the monitor specs. The horizontal scan frequency should range from 30 to at least 38 kHz. 48 kHz is recommended for higher refresh rates or resolutions on Falcon 030 machines, ST's high res requires 35,7 kHz.

Note that the freq range must be continuous, monitors with frequencies 31,5-35,5-38-48 (typical DOS box stuff) will limit your facilities.

Subject: STalker/STeno/STill
Newsgroups: comp.sys.atari.st
Summary:
Keywords:

Dear Folks:

Put this up, got lots of great responses, including a few from
Eric Rosenquist, author of these two great programs, but danged if we ever
solved the problem--in brief:

When I transfer text from STeno 2.0 via the clipboard (CPXed w/
that German CPX version to my ramdisk, CodeRam), the TAB characters,
apparently not translated into spaces, turn into backspaces on our IBM AIX
system running PICO. Results--HAVOC! I can save a STeno text file to
disk (including, as usually, the ramdisk) and shoot it through STalker
with no problems, but I still feel as if I've got a crippled eagle,
here--I'd like to save the extra step, or use the "Type Ahead" feature
from time to time. Eric thought the problem might be my modem, but with
the Ted editor (also on our system), this doesn't happen, and the modem
tests I ran seem to vindicate the thing. Theories, anyone?

Rob S. Rice, U. of Penn.
Where ENIAC is still appreciated

Oh--it's a color Mega STE 4 w/2.06, folks, and much loved.

3402. LZH/ARC/ZIP/ZOO Header Format - Help!

> recover sectors from floppy

You said the boot sector and FAT were damaged. If the boot sector is damaged in the right (wrong?) way, logical to physical sector conversions can get pretty screwed up. If the info at the start of the boot sector is intact (sectors per track, number of tracks, sector size, etc), then you're in luck.

> it starts at logical sector 17 and continues to about 690

Okay, allocate a buffer of 673*512 bytes, and then do this:

```
status = Rwabs(0, buffer, 673, 17, 0);
```

(The first number is 0=read, 1=write; the last number is 0=A:, 1=B:, etc). The major potential problem with Rwabs() is that it relies on valid info in the boot sector to do its logical->physical sector translations, and if you boot sector is screwed up, Rwabs() can either fail, or it can appear to work but return the wrong data.

A simplistic fix for a bad floppy boot sector is to use Rwabs() to read the boot sector from a known good floppy that was formatted the same way, then write it back out to the broken floppy. Just read/write logical sector 0 (and prompt for a disk swap between the read and the write). Also, be careful of the fact that you'll have two disks with the same serial number after doing this, and DOS won't properly detect disk changes because of this.

: And what's this about a Diablo emulator?

I have a copy of the Diablo emulator, distributed by Atari. It came
with the printer, allows use of Bconout, and looks great.

For fancy graphics, you have a few options:

*) Get the Laser Printer GDOS driver, and write to the printer using
VDI calls. (I think this came with the printer, too).

*) Write PostScript output in a file, and then use UltraScript to
print it. Although this is somewhat inconvenient and slow, it has
some advantages:

-) PostScript is a great language. You can construct pictures
which you can change in major ways by changing only a few commands.
It's a lot of fun to program in, and can be very human-readable and
human-changeable. This way, you don't have to anticipate _every_
little thing the user _might_ want to do.

-) PostScript is a standard; you'll be able to use the program on
your next computer, or print the output at your local copy shop.

-) In my experience, UltraScript produces better-looking pages
than GDOS and VDI.

There is no need to mess with the DMA port.

GIGGEY Mike S (giggey@ecf.toronto.edu) wrote:
:
: This is a request for help!
:
: I have found that it starts at LOGICAL sector 00017 and continues to about
: locical sector 00690 (decimal values). Using Knife, I have been unable to
: ascertain what sectors/tracks/sides these are [frustrating!].

Figure out:

1) The format of the disk you're trying to save (sectors/track, # of
sides).

2) The length of the FATs and root directory.

If it's a normally formatted disk, these values are well known.

From these, you can figure out the sector # of the first logical block
you want to save. Then, convert the sectors you want to read to
track/sector/side triplets and use floprd. Alternatively, use
Floprd() to read the _whole_ disk and write it to your hard disk.
Then use your program of choice to save your file:

*) If it's a text file, use a text editor and throw out all the
garbage before it.

*) If it's not a text file, use the above-mentioned information to
determine where in your disk image your file starts, and use simple
file read/write commands to extract it.

I advise against using assembler to do this. What's the point?

[Posted on 20 Jun 1993 01:25:43 GMT]

Dear Friends:

I own an Atari 1040ST and I recently added :
1. 4096 KB of RAM
2. an 80MB hard drive
3. HBS 210 processor
I use Zignum's word-processor and when I finish, I save my document with
not an apparent problem!
Now, here my troubles begin:
when I recall the file that I previously saved,
either to 1)dump it at the screen or
2)print it
at the screen I see the message "SYSTEM ERROR - 97"
and the hard drive fills up with BAD sectors and I have to
reformat in order to reuse the program and all my data that I
previously inputed are GONE !
...please any ideas....
I would appreciate any help--I'm beat !-------e-mail:akakavel@dante.nmsu.edu

Hi Ian!

> The upshot of all this is that the DRI2GNU program at a.a is definitely
>buggy. It handles both BSS-based symbols and absolute segment-based
>relocs improperly. I hope to write a GST2GNU (which will handle both DRI
>and GST input) fairly soon, but I've got HSC and GemFast bugs to fix first.

Thanks for pointing this out... (If you don't remember, I'm the author...)
I've originally written DRI2GNU to convert some assembler code to the GNU
format, and I really liked MASM from pure-C for it's abilities with macros
and such. (As opposed to GAS). I'm afraid I never tested thoroughly with
BSS symbols... nasty bug!

I'll fix it, when I'll have some spare time again.

C'ya, Joe

I don't think Calamus supports PostScript, therefore any captured output
would be raster information. If Calamus supports output of some standard
image format (such as IMG) to a file (PageStream does, so I guess Calamus
would too), then you can take images of files to print on your laser
printer (assuming you have tools to convert them to whatever the
printer will accept - PBMplus tools, for example).

The IMG image format is an OK compression algorithm too, for black-and-white
(or bitplaned data) of the type typical in DTP, so the resulting files
shouldn't be too big.

From: korg@daneel.rdt.monash.edu.au
Message-ID: <korg.740639534@daneel.rdt.monash.edu.au>
Source record: 37914

Hi!
I have a BMS micro systems ST to SCSI controller and I was wondering
if it is possible to get 2 (or more) drives running on the 1 controller.
Yes, I removed the termination on the 2nd drive. The software seems to
be able to do it, but when I tried to get it going, it didnt see the
2nd drive.

Also anyone have code to send 'wake up' commands to drives? It seems
some drives need it (and I have access to one that needs it). No, thats
not the reason the 2nd drive didnt work :-)

have fun,
cam

As far as I remember you have to plug it in this way:

```
----------------
***put 1 here***
----------------
***put 1 here***
```

Here is the keyboard.

But it does not do any damage if you plug those SIMMs in a wrong order
into those sockets.
I remember that I had to test all possible combinations and it was the last
combination.(of course)
You can also plug 2 of the old 256k SIMMs into the empty slots. The STE MMU
does not recognize them correctly at boot time but there is a small prog on
a.a.u.e that fixes the 2.5 MB problem on a STE.

regards,

Marcus

Can it be that Gulam's convention is just not good enough for dlibs? I am rather certain that it lacks for example the special byte count value (126 or so) in the traditional command line. This weekend I experienced some problems with the command line when calling a hsc1.40 compiled program with gulam with env_style=mw set. The command line was truncated and at one time I experienced a couple of very strange arguments in the beginning (i.e the first two arguments were mangled). I don't have the source code of the new dlibs so I couldn't check the code (is it available?)

Okay, I'm using GCC 2.4.2, the MiNTlibs pl30 and when I come to compile any program (even the classic "hello world") it refuses to link because it says that there is an unreferenced symbol in the object file produced.
This symbol happens to be ___main

What am I doing wrong here? I have been using GCC for ages and never had this problem.

Any help would be most appreciated.

Either get mlib32 or add the following modul to your pl 30 libs.
void __main(void)
{}

I would suggest the former. Try the -S option, look at the output and
then you can see why ld is complaining. I'm not sure what this new
feature is for .... perhaps entropy will read this and let us know ...
;).

It's slots 1 and 3 as far as I know. You will have to remove ALL SIMMs,
you can't have 2.5MB like on an STFM.

The standard way in the real-time world to ensure a process gets enough CPU to do it's work in the time allotted is to assign the proper priority to the task. Most multitasking systems supply a method to designate task priorities, with a certain priority level designated as 'real-time', which basically means it's non-preemptive (it only gives up the CPU when it's waiting for other resources, like I/O completion).

If mTOS doesn't have such priroritizing facilities, it's not worth it's weight in bits. If it does, that's what they're for (that is, games hogging the machine an not needing a reboot on exit).

> Gulam & MW-style args...perhaps it doesn't put the special length byte
> in the basepage (127).

If that's the case, dlibs (and any proper implementation of ARGV as I understand it) won't recognize the args in the environment area. (That length bytes validates that the args were placed in the env area by your parent program, and not just "passed through" from your parent's parent because your parent is unaware of the standard.)

> Is the source for the new dlibs available?

Not for HSC 1.40, but the 2.0 release will contain lib source. Here's the current args handling (it has a couple bugfixes in it, but is otherwise the same as the 1.40 code).

```
-------------- cut here --------------

```
To do this, the tone and noise generators in the sound chip are turned off.
Only the volume controls are used. The amplitude of the resulting waveform
is a rather messy function of the three volume settings; all sample players
I've seen used a lookup table to map amplitudes to register values.
Once you've got such a table, it's just a matter of stuffing values into
the volume registers at high speed.

Lemme see ... <rummaging in mailbox> ...
Here's an article (two years old) that actually gives some code.

; Hi,
; as i got many, many requests about the source-code to play digitized
; music, i decided to post it instead of mailing to everyone.
; don't be confused by the letter like style, cos i just post the
; letter i've written to the first ones.

; I DIDN'T WRITE THE SOURCE, BUT TOOK IT FROM A ST-MAGAZINE ARTICLE AND
; CHANGED IT TO FIT MY NEEDS !!! (just wanted to make this clear)

; here's the promised source-code. It is NO executable program, but to
; be compiled as an object file and linked to a C-program.
; How to use it from a C-program:

; if you want to play a sample:

; set smp_anf_ to the begining of the sound-data.
; set smp_len_ to the length of the sound-data.
; set smp_frq_ to the playing frequenzy (0 to 30.000 in Hz)
; set smp_out_ to the scan-code of the character you want to abort playing
```

```
; before the end has been reached
; set smp_way_ to 1 if you want to play forward, any other value, if want
; to play the sample reverse (really funny flag)
; set smp_mod_ to 2 for playing samples
; start with start1();

; you don't have to set 'em all, just look at the default values at the end
; of the listing.

; if you want to listen to a digitizer:

; set smp_mod_ to 0 for listening
; set smp_frq_ see above
; set smp_out_ escape character (SCAN-CODE!!!). IMPORTANT: no exit from this
; mode with an wrong scan-code !!!! only way then is reset-button
; then start1();

; if you want to record samples

; set smp_mod_ to 1
; set smp_frq_ to the frequenzy you want to sample with (0 to 20.000 in Hz)
; set smp_anf_ begining of sample-buffer
; set smp_end_ end of sample-buffer
; set smp_out_ see above. program terminates as well if reaching smp_end_
; then start1();
; in return smp_len_ is set by the program to the really sampled length

; If using a digitizer, it should be at the printer-port!

; I hope all this above is true, as wrote it more then 1 year ago, but
; you should be able to correct it by looking at the code.
; I'm not shure about copyrights, as I took a computer-magazine-article
; about a self-made sampler, and adapted their source to fit my needs.
; If they don't have the copyrights, then the rights are by me. You may
; copy it, adapt it, delete it, throw it a you're brothers head, or do what
; ever you want with it, but don't blame me for the results.
; It would be nice, if using it in a program, to insert the names Martin
; Backschat (the original author) or/and Carsten Friedrich (me :) .

; this program is written for the Devpack assembler, so you might have
; to change some lines for other assemblers. (e.g. dc.l to .dc.l)
; the program can play 8-bit samples (should be standart), but only uses
; 6-Bit, because i only have a 6-Bit sound-data-table :(. If you get hold
; of an 8-Bit table, i made a mark in the source, what you would have to
; change. (and please mail it to me .... :) )
; although working with interupts, this program always (no matter what
; smp_frq_ ) uses 100 % CPU-time. This was made to improve speed and with
; that to improve sound-quality. I made a mark in the source, with some
; hints how to change that. but smp_frq_ should not exceed 20.000 Hz when
; doing this and if you want the computer to have the time, really to work
; while playing 10.000 Hz is a kind of limit. (Remember real sound-frequenzy
; is 0.5 * sample-frequenzy !, this means setting smp_frq to 10.000 Hz means
; a real sound of 5.000 Hz )
```

```
; The program uses Timer D for interupt. If you want to uses RS232, you
; should change this to Timer A. I used Timer D, as I needed Timer A for
; more important things.

; I hope that helps you. Lables might be a bit confusing for you, as i named
; them in german.

; if using Devpack, you should be able to assemble it just as it is.
; sorry, just noticed, that it is executable, just remove the line XDEF.
; you should just add Pterm0 (gemdos(0)) if you don't like it to terminate
; with two bombs at the end, then assemble it as an executable program (*.tos)
; and you can listen to a sampler, if one is connected to the printer-port.
; to stop press space :)

; if you still have questions, or it just doesn't work, mail me and I'll try
; to help you. If you send me some money for stamps, I can send you the
; source listing of Martin Bachschat (it's a complete assemler program to deal
; with samplers at the printer port ca. 900 lines). If you send me a disc, I
; can copy the source-code and executable-code of a C-program I wrote for
; sampling and playing samples with the MarkWilliams C-compiler. It uses
; this assembler program for handling the sampler and sound out-put. I don't
; e-mail it, as it includes a .rsc file. But PLEASE don't forget to add some
; money for stamps and a disc, if you want my program.

; greetings,
; Carsten !

Strange that you found your command line truncated if you set Gulam's
env_style correctly. Note the correct syntax for setting it does NOT include
the "=" sign you quote - but you probably know that.

All I will add is that I have successfully copied whole Hard Disk
Partitions with the command

cp -r * <destination_directory>

entered from the root directory of the Partition I'm copying having
"set env_style mw" of course. I don't have to point out that in this case
that "*" expands to an enormously long tail (which was _NOT_ truncated). I
should add I was using the last Gulam version (4.0.5 I think).

Cheers,
W. Alan B. Evans.

3427. File sizes in C

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-22 00:29:22 UTC
From: bgilbert@cs.washington.edu
Message-ID: <1993Jun22.002922.12945@beaver.cs.washington.edu>
Source record: 37929

Hi folks, I am trying to become proficient at C on my ST (and Falcon soon hopefully), but I keep running into weird snags. Here's my latest one :

I simply want to find the size of a file on disk, using HSC 1.4 and TOS 1.0. I've tried this two ways with the following code :

1) Using the call fsize() from dlibs, as follows :

```
long filesize;

filesize = fsize("test.c");
```

This usually provides an answer of zero when I try to print out the filesize (with printf).

2) Using the unix method, ie fseek and ftell :

```
long filesize;
FILE *fp;

fp = fopen("test.c", "br");
if (fp > 0) {
fseek(fp, 0L, SEEK_END); (parameters might be a different
filesize = ftell(fp); order, I don't remember now).
fseek(fp, 0L, SEEK_SET);
}
```

This gives about the same results, namely a file size of zero.

Am I missing something really obvious here? I seem to be able to read from the files OK but for a lot of applications I need to know the filesize so I can do a block read instead of one character at a time. Any help is appreciated!

Regards,

I have been giving LOTS of attention to the subject of GIF files on the ST(e). Here is what I have learned about converting them into Atari formats:

1)It is desirable to do so. The redundant information that the GIF format stores (compressed as it is) means that any Atari specific format will result in a much smaller file on the ST. I've turned 50K GIF's into 5K *.TNY files.

2)The assorted conversion utilities all work differently, meaning that the picture that PCHROME3, for example, leaves dark, SPOFLIT will let you view and lighten, but not save as converted, while VIEW_ST often does an excellent job of shrinking large files but only into 16 colors. DMJ_GIF 3.0 is flicker free, but very slow, in turning GIF's into SPC files, but itself encounters files it can't turn into a decent picture (All these programs are available on the Michigan Archive).

Prism Paint will load and shrink any GIF your system can display without modification, but will not convert colors and often blacks out the screen after the conversion. GEMVIEW 2.24 pushes your system to the limits of the hardware in making its conversions, but no further, unlike such software-enhancers as PCHROME3, SPOFLIT, or DMJ_GIF. On the other hand, it can be used to lighten a GIF to the point where PCHROME can make a decent conversion of a dark one. I wish meine deutsch was gutt enough for me to understand how to adjust the RGB levels of the various pictures--monitors, and accordingly, exact amounts of Red, Blue, Green, and intensity, vary. Somebody ought to write a test program to figure out adjustments, if necessary.

If anybody knows of any better programs or routines, I'd love to hear about it. The best single advice I can offer is to determine how many colors and how large any GIF file is before you try to convert it, and learn within what limits each program does its best. Best overall, but still imperfect, is PCHROME3, but there are rumors of a world-beating DMJ_GIF 4.0 in the works that should surpass it.

The ATARI world is also in dire need of a program that will read and convert ATARI *.IFF art files, and show them slide-show fashion (unlike the exercrable, bell-ringing horror that came with Deluxe Paint). Not even GEMVIEW 2.24 can do that (although GLEE, long gone, could!). ATARI *.IFF files (compressed with a platform-specific

algorithm) are nearly as small as TN? files and, unlike the latter, can still be loaded into Deluxe Paint. You can also compress BLOCK files in Deluxe Paint. Would-be world beaters, take note!!

>What am I doing wrong here? I have been using GCC for ages and never had this
>problem.

get a newer PL. i just found this out too (thanx, jrb++). you will also
have this problem with non-MiNT gnulib PL < 88, i think. MiNT lib PL32 is
the latest on the archives.

PL32 has ___main. you can also put a dummy together (for C only)

```
void __main(void){return;} /* note the 2 "_" chars, not 3 */
```

compile and add to PL30 with gcc-ar (i actually did this to non-MiNT gnulib's
crt0.c file). you could do this with PL30 crt0.cpp, too:

```
.globl ___main
___main:
rts
```

should probably work. otherwise compile the C version to a .s and include.

I usually do this:

```
for( i = 0; i < argc; i++ )
printf( "Argument %d = %s\n", i, argv[i] );
```

```
> I am more interested to see the value of argv[0] in order to determine

```

I think it's an OS version/shell problem. I have TOS 1.4 and use Mupfel as well as tcsh (under MiNT) and argv[0] contains the program name. I'm not sure if this works from the desktop or not (I haven't run a command-line program from the desktop in years).

You can, I've seen it done with a progaram called SIMMFIX, though the program
isn't always reliable in getting the ST to recognise the memory configuaration.

Is there any technical reason why this *shouldn't* be done ?

Sam

3433. Gulam clarification & ? [was Re: argv question ?]

>should add I was using the last Gulam version (4.0.5 I think).

Welll, since cp is a builtin, who's to say that Gulam's using *any* standard
argument-passing technique? It probably just pushes a few pointers onto the
stack and goes to a "cp-subroutine". That's not the same at all as using the
OS-supplied Pexec... Of course, if you are talking about a cp aliased to
an external cp.ttp, your point would be valid, but that you didn't mention
this caveat seems to imply not.

As others have stated, set env_style mw (or something essentially similar) is
the way to enable extended argument passing such as is available in Gulam.

Also, the only released versions of Gulam that I know of are x.y.z.a (whatever
the numbers are--I don't remember) Alpha and Beta. The latter is apparently
the more recent version, and should be available on atari.archive and friends.

>Cheers,
>W. Alan B. Evans.

P.S. I seem to remember that the original author of Gulam (Is he still at
Wright State?) many moons ago offered to supply sources to those with a need.
My general irritation factor has been steadily building with a few features
of Gulam, and I've considered fixing 'em. Things like converting to full
ARGV, fixing the builtin mem, fixing the Ins key in the minibuffer, adding
full-Minix-length filename globbing, etc. Has anyone ever looked at the
sources to see how hard this would be? I assume that since Gulam is so small,
it's probably in assembly, but since it was written for an academic project,
maybe there's hope...

Howard? Jwahar? Surely these very same issues have been bugging you for
years too... Has anyone's irritation factor reached overload status yet? :-)

WABE> Strange that you found your command line truncated if you set
WABE> Gulam's env_style correctly. Note the correct syntax for setting it
WABE> does NOT include the "=" sign you quote - but you probably know that.

Yes, I know. I just misquoted it. It has been in my gulam.g file for a long
time.

WABE> All I will add is that I have successfully copied whole Hard Disk
WABE> Partitions with the command

WABE> cp -r * <destination_directory>

But cp is a built-in command. Besides that it also depends on the receiving
program. Gulam does pass all the arguments as I have seen by using GCC
compiles programs.

> flow to CTS/RTS?

I tried the HSFIX program that was posted on the net a while ago, and it
didn't work properly either (STe, TOS 1.6). Although it did correct the
problems with overrun and losing characters, for some reason at high speed
it dropped my terminal speed from 19.2K to 9600 when it connected. I've
also had problems with SERIALFX 1.0 and 2.0, although 1.1 did work (but then
you have to use that stupid CPX). I'll repeat again, a patch that I've found
works perfectly on my machine every time is TurboCTS 1.32 (written by the
same guy as SERIALFX). It also doesn't require that dumb CPX. Works for me.
I can post it somewhere if someone wants it, I don't think it's on a.a,
but it should be. It might not work on Falcons or something, but I was kind
of expecting Atari to fix this crap by now. :)

Granted "cp" is not a clear cut example. However when I do use GULAM
with external programs I never seem to have the command line truncated
provided env_style is "mw". To be doubly certain, I've just tried it with
FDATE.TTP (a little utility I wrote that prints out the "full" dates
including the year of files) and the command

fdate *

listed _ALL_ the file dates in a huge partition - BUT

unset env_style ; fdate * ; set env_style mw

listed about 4 files _ONLY_ before the tail was truncated.

So although my example was ill-considered, the allegation seems still
to be valid i.e. I still have not noticed any truncation effects with
env_style set as "mw".

Cheers,
W. Alan B. Evans

3438. Re: File sizes in C

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-22 19:55:04 UTC
From: healy@nosc.mil
Message-ID: <1993Jun22.195504.4075@nosc.mil>
Source record: 37940

One problem people run into when printing out longs is
to forget to put the "l" in the format statement, eg "%d"
instead of "%ld". It depends on the compiler, ie, my Laser
C (where ints are 16 bit) needs the "l", whereas gcc on
my VME 68040 boards (where ints are 32 bits) does not.

3439. Memory help needed

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-22 21:08:59 UTC
From: elvis@watserv.ucr.edu
Message-ID: <33188@galaxy.ucr.edu>
Source record: 37941

Hi,
I've been working on a program, and was wondering if someone could answer a few questions I have concerning freeing memory. At the moment, my program simply takes all the memory, but with Multi-TOS on the way, I figured I should try and change this, which left me with my questions. First, the program I am working on is a shell for calling archivers. As I understand it (which may be completely wrong), these archivers are run in the heap space of my program when Pexec()'ed. If this is right, does my shell need to keep most all the memory anyway, Multi-TOS or not? Or will the programs run in freed memory? (Another reason why I am trying to make this change is that people are having problems running DC-squished archivers. If they unsquish them, it works fine, but when they are squished they get two bombs, but the shell keeps running. So I wondered if there needed to be memory free to unsquish the files.) In any event, how do I free up the memory I do not need? I have tried Mshrink, but it fails unless I shrink it down to about 40k or less, at which point the program bombs when I try to do anything. Any help on this matter would be greatly appreciated.

Thanks,
Andrew Cullum (elvis@watserv.ucr.edu)

3441. File sizes in C

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-23 00:23:29 UTC
From: bgilbert@cs.washington.edu
Message-ID: <1993Jun23.002329.25300@beaver.cs.washington.edu>
Source record: 37944

Thanks to everyone who responded to my question about file size info in HSC. It turns out the problem was just in my printf statement, since I couldn't figure out how to print a long value (I tried %l but that didn't seem to work too well... :-) The main difficulty is that I'm porting some Unix-type source code and it assumes that ints are 32-bit which of course isn't always the case on the ST.

Now that I fixed that, however, I have one more problem : How do I read a series of bytes from a stream where the byte count is a long value? Fread seems to want an int for the byte count, and lread doesn't work on streams. Is there a way around this somehow? Also, when I do try to do an fread where the number of bytes is an integer, I get two bombs without fail. Is there a common problem which would cause this that I am unaware of?

Thanks again for all the help!

3442. Color PS driver for Pagestream

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-23 02:02:06 UTC
From: fsctc@avelon.lerc.nasa.gov
Message-ID: <208diu$rs7@eagle.lerc.nasa.gov>
Source record: 37945

Okay, guys, I need help. I need to print some pages with color onto disk from my Pagestream 2.2b. I have a file called colorps.prt in my printer folder, but no driver is loaded when I try to load the colorps.prt as my printer driver. Anyone else have this problem? The file is 17408 bytes long.

I can load the regular postscript printer driver and print to disk. However, there's this other file named pscript.hdr that seems to go with pscript.prt. Do I need a similar companion to my colorps.prt file?

If you can help, please let me know as soon as possible. I've got a conference coming up this weekend with some viewgraphs that I need to make. My plan is to print color postscript files to disk, and then print the files from a networked color postscript printer. Thanks.

Clarence

3443. falcon caches

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-23 08:28:04 UTC
From: steve@wan.inf.rl.ac.uk
Message-ID: <13693@hardy.rl.ac.uk>
Source record: 37948

Some questions about the 68030 instruction & data caches on the falcon:

1) Are they on or off by default? (I assume off for ST compatibility)
2) Can they be turn on at all? (68030 manual says they only work with 32bit bus ops but falcon data bus is 16 bits)
3) If so do they improve or degrade performance? (I would expect instruction cahce to be a win, but data cache might be a lose if most instructions use 8 or 16 bit accesses since this will force an extra read)
4) If so does TOS 6.01/6.02 work correctly wrt to DMAs (ie flushing data cache before reading from DMAed memory) and I/O locations?
5) Are I/O reads marked as non-cachable by Falcon hardware?

The falcon docs I got from Atari say nothing at all about the 68030 caches so I'm assuming the worst.

Steven

3444. falcon video

3447. move video questions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-23 10:34:54 UTC
From: steve@wan.inf.rl.ac.uk
Message-ID: <13697@hardy.rl.ac.uk>
Source record: 37951

How does one

(a) Find out if non-standard (eg ST-Overscan/Ste/Falcon) screen mode is in use and get virtual/displayed widths & heights and layout

(b) Tell Gem/line-A etc that you have set up some nonstandard display.

I assume there are some system variables that can be read and adjusted. I need to be able to read this info so that my custom (interrupt driven) screen update code will work with as many non-standard screen configuarations as possible. I assume the line-A variables are "out of bounds" for anything other than the 3 standard ST resolutions.

Also, if hitting screen memory is a BadThing is there any legal way to write to the screen from an interrupt? do any sequencers that maintain a realtime on-screen clock manage to work with 3rd party video boards?

Steven

3448. Re: Capture printing output of Calamus

Yes, I know. Then import it into WP :-(and print it. But you allways
loose quality because of all the processing which is done. And I am
not certain if WP understands 600DPI IMG files. So I was looking to
capture the raw printerdata and then send it later to the printer.

>> The IMG image format is an OK compression algorithm too, for black-and-white
>> (or bitplaned data) of the type typical in DTP, so the resulting files

This is ofcourse true.

>Fread seems to want an int for the byte count, and lread doesn't work
>on streams. Is there a way around this somehow?

First of all fread() doesn't need a byte-count, but an 'item-count', which is quite different. Second, fread() requires the 'count' parameter to be of type size_t, which needn't be int, and in fact on my compiler (Pure C) is #defined as long. Less than a week ago I hacked up a small thingy that reads 100k bytes from a file with only 1 fread().
Just a plain fread(buf, sizeof(buf), 100000L, filep) (may have the order of arguments wrong...).
Personally, if my compiler limited me to reading 32k from a file at most (as you seem to suggest), I would consider getting another compiler. The only other solution I see offhand (without having other info) is to do multiple fread()'s. No, that's not funny, I know...

I've seen a gadget called ModemMIDI (or maybe MIDIModem ?!) in some club cubase bumph. This gives you another MIDI out by connecting a small widget to the atari's Modem/rs232 port.
I want to find out:
how much?
% discount for club cubase members (i.e. should I join if all I want is ModemMIDI)
how to get hold of one

or:
how do I build one (what's the wiring diagram)?
how do I get cubase to use it?

AdvThanksance

As far as I know, SIMMFIX always works as long as you put the SIMMs in the correct sockets (there's a diagram in the README file -- I know, because I put together the first SIMMFIX release :-)

In recent articles and correspondence, I've seen references to an entity called XHDI. I've gathered that it's an "eXtended Hard Disk Interface" [nothing slips by me, eh? ;)], and I have determined that I don't have it.

The obvious questions, then:

- What additional functionality does it provide?
- What form does it come in (TSR, CPX, TLA, ???)?
- Do I need it?
- Where can I get it?

[In partial answer to the latter question, I've check a.a, uni-kl and uni-muenster to no avail.]

> Freeing up memory before running other programs, etc

A program you Pexec() does NOT run in your heap space. It requires free memory. If the program has been compacted, it will require extra free space to unpack itself into, that probably helps explain your bombs.

You didn't mention what language you're using. If it's C, your runtime startup code has already done an Mshrink() for you to free up memory beyond the end of your heap/stack area. If you're using another language, this may not have happened, I dunno. (My advice in that case would probably be: try using a real language.)

Source record: 37957

> Falcon 68030 caches

1) Data and instruction caches are on by default. At least, by time the
desktop comes up they are; they may be off early in the boot process for
compatibility with old boot-into games loaded from floppy. The machine
also runs at 16mhz by default, although 8mhz operation is possible.

2) The caches can be turned on or off, and flushed, as described in the
Motorola manual.

3) The data and instruction caches definitely improve performance. A lot.

4) I've never heard of TOS 6.0x, can't help with that.

5) In my work on Cyber Paint, I hit hardware registers a lot, reads and
writes, and have never had a problem with getting old cached values,
so I'd have to surmise that the system design properly handles accesses
to memory-mapped I/O devices.

One problem I do know of is that there's no hardware-level enforcement of
cache coherency between the blitter chip and CPU. If you use VDI or
Line-A calls, the OS flushes the data cache for you after a blitter
operation. If you program the blitter chip yourself, you have to handle
it. I assume the same rules apply to DMA and DSP-DMA -- OS calls will
handle things for you, but if you touch the chips yourself (or if you're a
device driver writer) it's up to you.

Message-ID: <1993Jun23.173919.20622@mnemosyne.cs.du.edu>
Source record: 37959

> Falcon video questions

a) Check the _VDO cookie. If its value indicates a Falcon, use the new Vmontype() call to figure out what type of monitor is in use, and the new Vsetmode(-1) call to get the bit-mapped word that describes the current video mode.

b) When you change video modes programmatically on a Falcon, use the new variant of the Setscreen() call. It automatically re-inits VDI and Line-A as appropriate to the new mode. It does NOT (as usual) re-init GEM; as always, there's no way to programmatically change resolutions then use AES calls. Also, when the video mode is not one of the ST-compatible modes, the Line-A variables are still valid, but the Line-A functions are not.

One thing that seems to cause older programs to fail, that you had better allow for in the Falcon age: when you change resolutions programmatically, the Line-A data structure and the screen address change. You cannot do a $A000 to get the Line-A pointer, then change modes and expect to use the pointer. You must redo the $A000 call after every mode change if you use Line-A. If you're using screen addresses, you have to redo the Logbase() and/or Physbase() calls to get the new screen address after after resolution change. And, a rez change call can fail if there isn't enough memory free to support the screen size for the new resolution.

If you use Line-A blits, be aware that as of TOS 3.01, bugs were introduced into the Line-A blit routines that bite when you use odd values for NXTWORD and NXTPLANE. (Er, not odd as opposed to even, but odd in terms of describing unusual bitplane arrangements. In particular, using a Line-A blit to transpose columns for rows fails miserably.)

>
> Steven

Last time I checked, the Atari docs are basically it. While I was working
at
Atari, there were efforts to keep the video register information
undocumented
so that when Atari did future machines, they would be able to change it at
will.

However, the Video Timing Generator (VTG, the name of the Video Chip) in
the
Falcon030 is very programmable. I people in Germany have already figured
out
how to program the VTG and have even given out lists of the registers and
their memory locations. You might look for one of those lists.

But, you certainly won't find that type of information in the Atari docs.
They want to be able to change it in the future.

No it is the combination of Gulam and dlibs (the dlibs from hasc1.40). I
think Gulam uses the old MWC convention which makes it compatible with MWC
of course. Dlibs uses the new ARGV convention which is slightly different
from the MWC convention. They are compatible in one direction but not in
the other one. I.e a new ARGV using program can call a MWC program and get
the desired result, but not the other way around. If gulam could be
recompiled to use the newer stricter convention all would be OK.

It's on ftp.uni-muenster.de in pub/atari/Docs/xhdi-110.zoo. The document should
explain all what you asked...

[Article crossposted from comp.sys.atari.st]
[Author was Rob S. Rice]
[Posted on 24 Jun 93 13:23:05 GMT]

'Lo, folks:

Hey--does anybody have a quick & easy solution for a key (on my
Mega STE 4's keyboard) that sticks, or takes multiple presses to work?
The "1/!" (worked that time) and sometimes the "2/@" key just don't go.
And sometimes it do. It MIGHT be dust, except that I'm a feind for
covering the keyboard, have used the vacumn (rigorously, after this
started), and don't abuse the thing. Whatever the cause, does anybody
know what I can do about it? Thank you!

3471. Quantum ELS 170 Meg for a MSTE?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-24 13:32:57 UTC
From: cordes@ac.dal.ca
Message-ID: <1993Jun24.103257.14600@ac.dal.ca>
Source record: 37976

I'm looking to replace the internal HD (ST157N) in my MegaSTE; it seems to have failed. The drive I'm interested in now is a Quantum ELS, 170 Meg SCSI 3.5" LP drive. I would just be using the drive controller built into the MSTE, and would hope to format with the Atari HDX v5 utilities.

If anyone has any experience or knowledge of this drive and its suitability for an Atari system, *please* post here or let me have your comments by e-mail. Thanks in advance.

I'd advise Falcon owners to get hold of a German program called Falcon Screen - this parades a list of - most of - the Falcon video registers and lets the user play with them to change screen size/etc.

It's available on Cix, in Britain but I don't know if it's made it onto a.a.u.e yet.

>are due to Sozobon(1.40) and _not_ Gulam.

It did seem to imply that, didn't it?. The opposite is true; it is Gulam
that isn't playing by the rules.

>Sorry if I misunderstood you - but if I get time I'll compile it
>with Sozobon and see what happens.

Don't bother, I can tell you what'll happen: the newly compiled program
will not see the magic length byte of 127 in the basepage, and thus will
not believe that a valid ARGV setup exists, and thus it will use just the
first 125 characters in the basepage command line and ignore the rest.

Naturally, if Gulam is using the old MWC convention, programs compiled
with MWC will work fine. But, the MWC convention is similar to ARGV, but
not exactly the same. The ARGV spec mandates that the ARGV information
(if present) be ignored if the magic length byte of 127 isn't present.

```
>> How to read long files in one operation with dlibs/HSC
> Cast the long byte count to a short.

That won't work, unless the long byte count is <= 65535.

There are a couple ways around all this. My recommendation would be to
punt stream I/O and use direct GEMDOS calls. (Fopen/Fread/Fwrite/Fclose).
When you're reading things in one huge gulp, it's faster to use the DOS
calls anyway. Or, you could use the low-level RTL calls (open/lread/close).
They just turn into direct DOS calls anyway.

Another thing you might be able to exploit is the fact that fread() takes
a short (really size_t) item count and a short size. Internally, dlibs'
fread() multiplies these to get a longword result and reads that many bytes.
But, be aware that other compilers where size_t is unsigned short may not
behave the same way; MSDOS compilers tend to have a 64k limit on the
*result* of the multiply as well as the two parameters themselves.

> [XHDI, "eXtended Hard Disk Interface"]

> - What additional functionality does it provide?
> - What form does it come in (TSR, CPX, TLA, ???)?

It's not a program, it's an interface description (i.e., sort of a
standard document.)

XHDI compatible harddisk drivers (that's what it's for) have several
interfaces that allow low-level appliacations to communicate with it,
i.e. they provide more information about the installed BIOS devices
than Atari's PUN_INFO structure, and support several special features
like starting/stopping/locking/unlocking a drive.

> - Do I need it?

The XHDI specification can be of interest to you if you develop a
harddisk driver or some other low-level harddisk software, like
a MiNT extended file system.

> - Where can I get it?

Look at ftp.uni-muenster.de:/pub/atari/Doc/xhdi-110.zoo.

Unfortunately, only a few German harddisk drivers already support XHDI
(none of which I've seen so far, probably because they're all proprietary
(i.e., they're shipped together with harddisk utilities which are
proprietary, too, and which I don't need); then again, everything
Atari-ish seems to be highly proprietary...).

I had the same problem with my Mega STE keyboard. I took it apart and cleaned
the circuit board(actually a thin plastic sheet with the circuits on it)
with alchohol(no! not Smirnoff :-) - this cured it. Be a bit carefull with
the bits though!

I have a Quantum 210mb drive in my Mega STE and it works fine. BUT you
cannot use it with the Atari drive controller. You must get an SCSI board,
I have the ICD one which is great but there are others available.

One way of doing this with a serial null-modem (pins 2 and 3 crossed, pin 7 connected at both ends) in C, both on ST and PC is to use the standard stream 'stdaux' with the normal fprintf/fwrite and fscanf/fread functions.

IMO using the parallel port on the ST would not be wise. It is possible to use it for input as well as for output, but you could blow up the sound chip if it is still in output mode and you feed data to it :-O .

That discussion had a follow-up on the MiNT developer's mailing list,
where one proposal was finally selected as a quasi standard (i.e.,
it's not yet an official Atari standard; see below).

This method is implemented in the newer MiNT library PatchLevels (PL 31
and up), and it's also supported by the ports of `sh' and `tcsh' which
I distribute (sh03*.zoo, tcsh6033.zoo); these distributions also
contain a document describing the proposal that I will cite below.
(You should know that I have written that text, so you should forgive
any spelling and grammer mistakes in it. :-)

Michael
--
Internet: hohmuth@freia.inf.tu-dresden.de

---------------------------------cut here---------------------------------

This is a proposal for an extension of Atari's ARGV argument passing scheme
standard. It has been discussed on the MiNT mailing list. Please note
that this proposal should not yet be regarded as an "official" Atari
standard; however, according to Atari's Eric Smith, it's unlikely that
Atari's new standard will differ a lot from the one proposed here.

*

This ARGV standard extension adds the possibility of passing blank (i.e.,
zero length) arguments via the command line when calling another program.

The ARGV extended argument passing scheme standard should be extented by
the following clauses:

If the command line does _not_ contain blank arguments, the old ARGV
standard applies; there are no additions. This is for maximal
backwards compatibility with old (unaware) applications.

_If_ (and only if) there are blank arguments, they're substituted by
single spaces in the argv[] representation in the environment and
by the string "''" (two single quotes) in the basepage's command
line representation. Their position in argv[] is signaled thru the
value of the "ARGV=" environment variable (which was reserved by
Atari's earlier standard for future usage). This value consists of
the string "NULL:", followed by a comma-separated list of decimal-

encoded indexes to the positions of the blank arguments in the
argv[] vector.

Example: The following command:
foo bar '' '' blah '' frob
results in the following being appended to the child's environment:
"ARGV=NULL:2,3,5\0foo\0bar\0 \0 \0blah\0 \0frob\0\0"
The basepage contains the following string at offset 0x80:
"\177bar '' '' blah '' frob\0"

A program which is aware of the new standard will notice the magic word
"NULL" in ARGV's value and will decode the argv[] indexes it signals.

A program which is not aware of the new standard, but which is aware
of Atari's old ARGV standard will see spaces in place of blank
arguments. The spaces have been introduced to guarantee that
the parameters stay on their positions.

Non-ARGV-aware programs (those which read their command line from their
basepage) should see the parameters in the right place too.. Of course,
a space can't be inserted in place of an blank argument because spaces
separate words in the basepage's command line, which is why the single
quotes have been introduced.

Those programs that use the value of ARGV= for other purposes (Mark
Williams C compiled programs) will conform/work as long as they're not
passed blank args. If someone tries to pass blank args to them from an
aware shell, these programs will lose. However, these programs would
also lose in this case if the (new) standard wouldn't exist (because
blank arguments are impossible resp. truncate the ARGV parameters in the
environment), so this is not really a problem.

A null modem cable is simply a cable with the transmit and receive wires
crossed so that transmit on on computer goes to receive on the other and
vice-versa.

>Printf looks for an int... try
>printf("Size= %d\n",(int)filesize);

If you don't know what you're talking about, please don't talk. Printf doesn't look for an int. That is nonsense, was nonsense, and will hopefully always be nonsense. Printf looks exactly for _that_ what you want it to look for.
If you want to print a 'long', supply the correct format string. I.e.:
printf("%ld", a_signed_long);
Casting a long to an int is generally a VERY BAD idea, since you may loose significant digits. What if filesize happens to be larger than what fits in an int??? And then: the '%d' signifies a _signed_ int, which makes things even worse. I suppose the fsize() function returns an _unsigned_ long, so if you really think you should cast it to int (which you shouldn't), at least cast it to an _unsigned_ int, and use %u instead of %d.
O, <grin> that means that probably in my printf() example the d should be a u too :).
Casting to int will break if filesize>32767 -- which will be the case quite often... (assuming 16bit ints here, which won't be too improbable for the ST).

E>widget to the atari's Modem/rs232 port. I want to find out:
E> [...]
E>how do I build one (what's the wiring diagram)?

There is a short article about this item in the last c't magazine (7/93)
here in Germany. I'll try to tell you the essentials.

You need a 25-pin SUB-D socket (for the RS232 port) and a 5-pin DIN plug
(i.e. the midi plug). Now connect:

```
RS232 port new MIDI port
----------------------------
pin 1 pin 2
pin 2 pin 4 (*)
pin 3 pin 5 (*)
```

(*) insert a 1.2 kOHM resistance in theses connections. The RS232 port gives
you 12/-12 Volt, MIDI can stand 5 Volt max.

The pins are numbered like this:(always looking at the connections to
solder)

```
RS232: 1 2 3 4 ... 13
o o o o o o o o o o o o o
o o o o o o o o o o o o
```

```
MIDI: 2
5 o 4
o o
3 o o 1
```

E>how do I get cubase to use it?

Cubase (Steinberg) and Creator/Notator (Emagic) support this new port.

Cubase (M-ROS V 3.31): activate EXPORT.DRV. The new port is then available
as 'XPORT1' in the Output menu of a track.

Cr/N: run the INSTALL program and click on 'Export' and 'Unitor'.

Some notes:

- This should work on any ST. Steinberg and Emagic say, however, that there may be timing problems, especially when there are other extensions present. Just try it, it's not _so_ expensive, I think.

- I don't use any MIDI equipment/software, so I can't check if all this is correct. Maybe there are some differences, e.g. concerning names of menu items etc. Of course, I cannot give you any warranty.

- I hope that my posting does not hurt any copyright laws. At least there shouldn't be any loss for the magazine, since the original article was written in german. You woldn't have bought it anyway, would you? ;-)

Hope this helps a bit.

Regards,
Andreas

: Don't bother, I can tell you what'll happen: the newly compiled program
: will not see the magic length byte of 127 in the basepage, and thus will
: not believe that a valid ARGV setup exists, and thus it will use just the
: first 125 characters in the basepage command line and ignore the rest.

: Naturally, if Gulam is using the old MWC convention, programs compiled
: with MWC will work fine. But, the MWC convention is similar to ARGV, but
: not exactly the same. The ARGV spec mandates that the ARGV information
: (if present) be ignored if the magic length byte of 127 isn't present.

This is all interesting, as Msh the shell that came with MWC always _did_
give the magic length byte when passing arguments. I always assumed that the
startup code for MWC was buggy for not checking for 127 and altered it to do
what I had seen elsewhere! Consequently I assumed the Gulam's lack of use of
the magic byte was a bug there too.

Interesting isn't it :-)

ZOO Problems..

A chap on GEnie hase programed a Archive converter, seems to think
that ZOO can't compress Directories or a Directory..??

If so what is the format..?

Is this the case, so can it do a R or a R2 as in LZH201 and
can you set the base directory as in LZH201, like \test\ *.*

This program looks very good CWACS3_01.LZH..

It can convert a batch of mixed archives to one, there is also a BBS version if
you Register it..

Some one might like to post it to A.A...??

Thanks.............

Source record: 37849
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there,

I've already left a posting on this subject about a week ago, but got no replies.

I've been having some problems with Hermes 1.04 not getting a file tranfered from my host node using the "uucp" command. When polling the host, uucico goes into slave mode receives a small amount of data (I know this only by watching the modem lights) then everything stops with no data transfer in either direction. After about 5 seconds uucico times out with a waiting for data block message.
I've tried a number of different strategies to get more info, including getting hold of the latest version of uucico (3.71) and also trying different size packets etc. While trying different packet sizes I got a further error message about a validation problem with some data. This is about the only clues I can offer. All signs would tend to point to trouble from my host site end, but the sysop there assures me everything is setup as it should be and that his site feed quite a number of different nodes quite happily without having had any trouble like this.
Any help or suggestions would be gratefully received. I've set everything I think should be set up like a UUCPPUBLIC directory. Is there somewhere where I should tell the system to accept files from my host (some sort of write permission system???)

Please help me on this one as I've been struggling for well over a month on this one.

Cheers,

I have just bought MultiTOS and have installed it on my TT030.

I rather like it, but would like it even better if I had some kind of graphics acceleration. I presently use QUICKTT when not running MultiTOS, but it appears I cannot run this under the new OS.

Does anyone have any recommendations for a MultiTOS-compatible upgrade or replacement?

NVDI - it's better than any of the QuickST, Warp9 or Turbo stuff. It's more compatible, faster and includes a *very* fast GDOS driver. Currently works on anything up to (but not including) the Falcon - although the Falcon version should be available in a week or two's time.

Yes, I know. Then import it into WP :-(and print it. But you allways
loose quality because of all the processing which is done. And I am
not certain if WP understands 600DPI IMG files. So I was looking to
capture the raw printerdata and then send it later to the printer.

I've just read about Calamus SL module that exports Calamus files both on
PS and EPS.

Sorry. Can't remember its name, but contact DMC and you get what you want.
The price was of course about 100 US$.

3505. Spectre and MIDI : a proposal

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-28 09:34:29 UTC
From: mczane@deis58.cineca.it
Message-ID: <1993Jun28.103429.1302@cine88.cineca.it>
Source record: 37855

Mac applications under Spectre GCR/128 cannot, at least to my knowledge, exploit Atari Midi interface. In the manual Dave Small wrote that these programs directly access Mac-specific hardware which does not exist on Ataris.

I think this situation has changed considerably. There are at least three solutions for the Mac which offer high-level Midi system services and hide underlying Midi hardware. I am referring to MIDI Manager/Midi Driver from Apple, OMS (Opcode MIDI System) and the forthcoming FreeMIDI System from Mark of the Unicorn which is under beta test and will be available also in source form.

It would be then extremely valuable to have an instance of a driver of this kind providing full Midi capabilities for Mac applications under Spectre. If this has not been achieved yet (I would like to know about Fearn & Music in Stuttgart) I am calling for a group effort to develop such a driver.

Unfortunately, I have no programming experience on a Mac (or emulated Mac) and Dave Small does not seem too active at the moment. Thus I am willing to cooperate with interested/competent people to achieve this ambitious goal.
Email me at mczane@verdi.eng.unipr.it.

210MB? Which one? I've had a LPS240S running with the internal MSTE
controller without problems. Quantum drives have a jumper to disable
the SCSI parity bit, that's what I've had to do, but no other problems
occured.

Hi there,

Could anybody tell me whether there is an option to gcc telling it to create executable file under MiNT on an minix filesystem (I mean with executable permissions set!)?

I was just porting some gnu software to my Atari, which I installed previously on our new Sun workstation. Rewriting the configure scripts a bit did most of the work, but I found it annoying to add a chown +x after every linking step (actually I find it annoying in my own makefiles, too).

Simply making minixfs adding execute permission to every program file does not do the job as the gnu scripts normally create files without any executable extension.

Thanks for any help in advance
Wolfgang

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
I've got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham or Ladbroke Grove
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you can't say fairer than that, can you.

Leave a message on 081-693-2846 and Ill get back to you
as soon as possible.....

Hello,
Please could someone please help me with a small problem. I am trying
to write a program that I want to use the mouse, but I'm not sure how to go
about it. I have the ST internals book, and it says that you supply the vector
of the new mouse routine, but I don't know how much of it must be in assembly
language, and what parts. I am writting the resto of the program in C, so the
more of that the better. What I would like is a sample code segment if it is
possible, as this makes my job easier (something to "copy"/use as a template).
If any one can help me please could they either post to this news group
or mail me directly. There is a copy of the finished program for anyone who
helps and wants one. The supprise is that you don't know what the program
will/should do. Fix my problem and you'll find out (don't you just love
intrege).

Thank you in advance
JTBean

3511. ZOO Directories

ZOOO HELP..

I posted a request a few days back and have had no replies..

Come on all you ZOO addicts, help some one that needs your Help..!!

Can ZOO 2.1 or 2.14 Compress Directories/Directory completly..

if so what are the commands...

This is from the person that is trying to get it to work...

```
---------------------------------------------------------------------
ZOO has the option to do directories with the // command, but it will
not do a complete path (i.e. G:\TEST\ G:\TEST\FOL1\ G:\TEST\FOL2\)
all in the same archive. At least after 100 times of me messing with
it, I could not figure out the command line to have it make an
archive out of a complete folder with files and folders inside.
---------------------------------------------------------------------
```

So is this possible with ZOO.

Or are you all keeping quiet because ZOO can't do this, were are all the ZOO defenders that have had a go at me in the past, come on now don't be shy...:-) come fowards and explain this to me...

Roher.............. sheppard_r@kosmos.wcc.govt.nz

Roger, I'm no zoo expert and haven't even used it for a while, but I looked up some notes I made once and it looks as though

zoo ah// archive.zoo .*

should do the job. The h is for high compression, the // is ST specific (I think) and I'm not sure if the trailing * is needed. This command should recursively archive all files and sub-dirs.

Note to zoo experts: If I've forgotten or overlooked something, please post a correction!

Good luck,
John

3513. gcc on Ataris ?

Hi Atarians !

I am new to the Atari. Reading this newsgroup I noticed that a few articles were about the gcc C Compiler. I didn't know it was available for the Atari. Could anybody please tell me what the system requirements (RAM, processor, OS) are to use gcc (On the PC you need a DOS extender or Linux to use it) ? Does anybody know if gcc will be available for the MultiTOS Operating System ?

Thank you for any information.

Eric.

>> Can ZOO 2.1 or 2.14 Compress Directories/Directory completly..

Yes, but the command to do so is, at least at the moment, specific to
the Atari port. Any Zoo can expand such an archive, however.

>> if so what are the commands...

zoo ah// fred lib\src lib\man etc...

>> --
>> ZOO has the option to do directories with the // command, but it will
>> not do a complete path (i.e. G:\TEST\ G:\TEST\FOL1\ G:\TEST\FOL2\)
^ ^ ^

These might be the problem.

>> Or are you all keeping quiet because ZOO can't do this, were are all the ZOO
>> defenders that have had a go at me in the past, come on now don't be

(sigh) Well, I can cite a number of .zoo archives off a.a that are full
directory trees.

come fowards and explain this to me...

> zoo ah// archive.zoo .*
^^

This, I think, is not necessary. If you want to archive the current
directory, you can just say:

zoo ah// archive .

> [...] The h is for high compression, the // is ST specific (I
>think)

More precisely, its use with the `a' command is ST specific. It also
works with the `x' command in all ports.

On UNIX, there is no need for a specific way to archive a directory
tree. Use:

find . -print | zoo ahI foo.zoo

Of course, if the original person had just read the built in help or
the docs that comes with zoo, all this would have been obvious...

cheers,

From: miskinis@korg.enet.dec.com
Message-ID: <C9EA2A.Mst@ryn.mro4.dec.com>
Source record: 37803

Hi,

I got severely delayed while writing an icon editor, to manipulate my "images", and to serve as another "demo" application.

For some reason the program would crash when I tryied to create 800 "widgets", in a 40 by 20 matrix on the screen.

After an in-depth analysis of my "widget" hierarchy, I could not find any reason for it to crash.

I lost a significant amount of time over this problem, but I found out what it was. Ready for this? My stack wasn't large enough to handle the recursive calls to draw the "widgets" on the screen...

ANYWAY, I've got a few days more work to do, and a demo will be appearing soon.

Stay tuned,

John Miskinis

>Roher.............. sheppard_r@kosmos.wcc.govt.nz
^^^^^
Is that a type of wine?

I believe that the standard unix and PC versions of ZOO cannot do what you
suggest in one go, however the people who ported it to the ST added two
"novice" commands -backup and -restore (or similar) which do exactly what you
requre. RTFM (without skipping the novice commands or the ST specific file).
Directories archived in this way will of course be dearchivable on other
machines, but you will have to use the equivalent of -restore which is
something like zoo x// "*".
It is possible that either a) This feature has since been removed from
the latest ST version or b) It has been added to other machines' versions.

What are you doing using zoo anyway Roger? Isn't lzharc far better? :-)

3519. Help with Desktop Replacement

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-30 14:52:07 UTC
From: skolodzi@vaxc.stevens-tech.edu
Message-ID: <1993Jun30.095207.1@vaxc.stevens-tech.edu>
Source record: 37872
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I started to write a desktop backgrond replacement program and ran into problems, I am looking for help.

I was tring the simple minded idea of using a wind_set(W_NEWDESK,...) to replace the defualt desktop. This does not work totally. What I get is my own desktop drawn with all windows drawn on the desktop updateing perfectly. The problem lies in the fact that I "THINK" the root of the Desktops Object Tree has the standard desktop, and then all of the desktop icons/dialogs, etc... hang off of that tree. This means that since I replaced the desktop tree with one object (my desktop picture) non of the objects in the default desktop tree (such as the drive icons) are displayed?

Is there a clean way to overcome this deficency? I have looked at some desktop replacement code and it seems to replace the GEM-VDI vector with a bit of code that checks to see if a area_fill of the right type is being done on the desktop, if it is then the code draws the portion of its picture instead, and returns; otherwise if the trapped VDI call is doing something else, then jump through the VDI's old vector that was replaced. This seems like an ugly solution?

Any help would be appreciated.

Cheers,
Scott Kolodzieski

3520. .5 -> 2.5 meg upgrade NEED HELP! Save an Atari ST!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-06-30 17:32:01 UTC
From: heonj00@DMI.USherb.CA
Message-ID: <heonj00.741461521@DMI.USherb.CA>
Source record: 37873

Hi, I have used the file 2_5ram.zoo of the directory Misc in atari.archive.umich.edu to try to upgrade my 520ST from 512k to 2.5 meg. The board is a 1040ST rev. 1. Unfortunately, something went wrong and I wonder if someone else had try and encountered the same results and if they could tell me what I did wrong.

So I followed the instructions and when I first booted the computer, the screen remained white and the drive light turned on but the disk drive was not working.

Second time I booted, bombs appeared from left to right.

Third time, severals bombs on the screen and the screen was flickering.

A point I wasn't sure while I was doing the wirying: at some point we have to connect the Vcc (pin 8) of a DRAM slot to the Vcc of the SIP but there are two Vcc on the SIP (pin 1 and 30). I hooked up to the 30. Did I have to connect with pin 1 instead or with both? Same problem with the GND, I hooked up to 22 but there were two possibilities.

Any feedbacks will be more than welcome.

The old ProDrive 210 cannot be formatted with Atari software on _STs_. After
formatting with a TT or Falcon, it can be used in a Mega STE.
Hooking it to an ICD or other adaptor will also work.

Symptom: When the PD210 is formatted via HDX, you'll get no more than 120 MB.

Weeellllll.... This is probably not what you want, but it works...
I like Unix, thus I compiled the Unix version of zoo for my TT.
With this and GNUfind, I add a directory (say the dir foo/) with the
following command:
find foo -type f -print | zoo ahI foo.zoo

Note, this is of course under MiNT with a shell that supports pipes.

The problem with the new ELS drives from Quantum is, that the jumper used for SCSI parity checking has been removed from the board. The ELS drives are using SCSI parity at default, and that's where the big problems with the MSTE just start: Atari's own drive controller only runs fine with disabled parity, but how will you use a drive with constantly enabled parity? There is a SCSI vendor specific command, but you need a system with enabled parity checking to change the configuration of an ELS drive.

Regards,
Robert

3525. Problem I am having with a SH204 hard disk

I'm not familiar with the .5 to 2.5 meg upgrade, but I upgraded my
Mega 2 to 4 megs by installing 2 off-shelf SIPP modules (under the
floppy drive: my revision had no free space on the motherboard for
the second 2 meg bank...), and I can suggest a few things to keep in
mind:

1) If you solder and wires between the MMU or motherboard and the
memory chips, keep the wires as short as possible. On my
(noisy) Mega 2 inches max did it, 2.5 did not and resulted in
a very amusing dot pattern travelling on the screen.

2) I pulled the supply voltage from the motherboard directly, not
from any chips. I used a bit thicker wires and pulled the
voltage from a filtering electrolytic capacitor installed on the
motherboard.

3) Check for cold solders and shorts. I spend 2 hours with a dead
system, before i found a short between the memory chips on the
SIPP board (!). It was a factory defect, with a drop of solder
shorting two pins of the memory chips. The machine was just dead.
If you get a cold solder it's usually not as severe: the system

will simply not recognize the extra memory in most cases.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've got access to ftp facilities for the next couple of days and was wondering if somoene could tell me where I could get a C compiler, fractal generators and some other more serious programs from. By serious I mean things that aren't games.

Thanks in advance.

Cerebus the Aardvark.

> Operating System ?

GCC runs on both TOS and MultiTOS (note that there are different
versions of GCC; the MiNT/MTOS version exploits some special MiNT/MTOS
features). You should have at least TOS 1.04 installed because
previous versions have a very slow file handling, and GCC deals
with a lot of files 8-)

The system should have at least 3 MB RAM (more for C++), and the whole
GCC/shell/utilities package uses quite a lot of disk space (40 MB
on my disk, but this includes a lot of sources, utilities, old
versions and UNIX stuff of all sorts). While GCC runs on all
Atari computers, it's more fun with a fast processor, of course.
I wouldn't want to use it regularly on a plain 8 MHz ST, but it
should be quite bearable on a 16 MHz ST or STE, a Falcon or a TT.

The best way to start with GCC is probably to get the starter's
kit by Simon *awfully sorry, but I forgot the name* from
atari.archive.umich.edu and install it. I didn't try it,
but people tell me that it makes installing MiNT and GCC much
easier.

Do you think it would *matter*? As long as {} is what you do I would
say `no it don't'. And if you're using a good C compiler it will accept
the former but not the latter (function should return a value).

Time for a new hard drive.

Sounds like a heat problem.

If the unit has a fan make sure it is working.

If there is no fan take off the outer shell of the case, the better convection cooling should give you a little extra time, and back up your hard drive partitions. Purchase a HD and host adapter (e.g., ICD Link), format the new drive, and restore your data.

Have the SH-204 bronzed :)

Brian

What about something like the 40 folder problem? Wasn't 1/2 hour of moderate activity about enough for all the (whatevers) to be allocated, and since in early versions of TOS they were never reused, suddenly you'd end up with (apparently) empty directories, etc...in this case, things should work okay after an immediate reboot. If that's what it is, just get foldrxxx.prg.

Probably a stupid suggestion, but just in case that's what it is, I'd hate to see someone toss a perfectly good hard drive for what is really a TOS bug.

don@cc.gatech.edu

How about some more info? What version of TOS are you running? What accessories? Are you using automatic compression software? Which ST, and how much memory? How long do you have to let it sit before rebooting will fix the problem? And if you are already familiar with the 40 folder bug and that's not it, please forgive me for suggesting something so trivial...

-Don Allison (don@cc.gatech.edu)

You aren't using an STe are you? this sounds like the dodgy DMA problem.
That used to take time to hit. Have you tried a shorter DMA cable?
Have you allocated enough folders using your driver or foldxxx.prg?

3536. New version of Texinfo available on ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-01 22:49:23 UTC
From: ntomczak@vega.math.ualberta.ca
Message-ID: <ntomczak.741566963@vega>
Source record: 37885

A new version of Texinfo - GNU documentation system with hypertext capabilities was posted to comp.[binaries,sources].atari.st and to atari.archive.umich.edu. The later one as as a single archive (look in Othergnu subdirectory)

This is of interest to anybody who deals with docs in Texinfo format (all these files with formatting commands starting with '@').

Programs include
makeinfo.ttp - formatter
info.ttp - on-line viewer
texi2troff.ttp - for [nt]roff fans; converter to this format
texindex.ttp - index filter used when you are typesetting Texinfo files with TeX

Those of you who are interested in printing reasonably formatted docs on a simple fixed pitch printers will paricularly interested in `--no-split --no-headers' options to makeinfo.

Programs makeinfo and texindex are coming from the latest version 3.1 of Texinfo. info is based on a previous release 2.16, since, unfortunately, totally new and much more capable info from 3.1 is still quite a bit buggy. texi2troff is somewhat older and by now obsolete. troff hackers among us should be happy to give it a face lift.

Enjoy,
Michal

3537. Gawk 2.15.2 binaries available

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-01 22:50:37 UTC
From: ntomczak@vega.math.ualberta.ca
Message-ID: <ntomczak.741567037@vega>
Source record: 37886

Executables of the latest version, 2.15.2, of gawk text processing
language/utility (GNU version of awk) were posted to
atari.archive.umich.edu. They contain some basic docs, but a full
version of a very informative manual (some 250 pages, or so) can
be found, with sources, in a regular GNU distribution of gawk.
To take a full advantage of MiNT you will have to recompile (which
is not a problem as long as you have an ANSI compiler). Posted program
should work 'as-is' anyway.

Enjoy,
Michal

leo@dcs.warwick.ac.uk (Leo Hendry) writes:

>I believe that the standard unix and PC versions of ZOO cannot do what you
>suggest in one go,

Any version of zoo can do that in "one go", since with 'I' option zoo
accepts from stdin a list of files to archive. A normal way to do that
on Unix is
find <dir_name> -print | zoo ahI archive.zoo
or variants of this. Disadvantage - you have to type more. Advantage -
you can be much more selective in what you archiving than with 'ah//'.

3539. MiNT, MINIX, GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-02 01:09:51 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C9IJ8G.17y@sdf.lonestar.org>
Source record: 37829
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I noticed a new version of GCC has been released 2.4.5 or something like that. The MiNT version is about half the size of the TOS version. Is the MiNT version missing something?? I mean, if I get the MiNT version will there be any reason for getting the TOS version? The reason I ask is that I can only get 1MB a day, and GCC for TOS is over 1MB, for MiNT it isn't.

Is the new MiNTLIB (binary) released? What's the full name and path at a.a.u.e.

Has anyone gotten MiNT1.04 to load XFS drivers?? I can't get to the desktop or even get the drivers to load with 1.04, but .95 works fine.

Has the new MINIX.XFS driver been released (binary). I compiled the source for the last one and it was SLOWER than the last one. In fact, someone said that MINIX filesystem was faster than TOS and I've found it to be MUCH slower. I have problems with some programs (compiled in GFA of course) and the MINIX filesystem, but not the RAM disk filesystem, and both are long filenames.

I was thinking of modifying the RAM filesystem to use the BLiTTER to do its memory copy functions, and maybe speed it up that way (make faster than the blazing it already is, much faster and more compatible than any other RAM Disk I've used). I wish I could make it fragment RAM less.

What are the rules on stack sizes for GCC that are 0 or negative?? What do those mean??

Has MultiTOS been released? I mean can I buy it from the local dealer (US). Also, someone told me that the falcon doesn't need GEM.SYS and MultiTOS would work just fine without it because the built-in GEM and GEM.SYS are identicle. Is this true? If so, then why load the GEM.SYS and waste over 200K?

Any help would be greatly appreciated. Ever notice that I do this about once every 2 weeks?? Oh well.

Oh, for anyone interested. GEMDOS and MS-DOS use th same function numbers. Weird huh? I just found that out.

>
> I haven't seen releases of the developers newsletter since the
> beginning of 1992. Were there many?

There were 10 issues of the newsletter way back in 1990.

1990 was the last year Atari had regular releases of the developer
newsletter. That was also the year that Charles Cherry left, and
developer support was picked up by Bill Rehbock. There was a
4 month lag after Bill took over until the first newsletter in '91
and there were 3 issues that year. (That was Volume IV.)

1992 started off with Volume VI (!), Issue 1 for Jan-Feb; followed
up by Volume V (right!), Issue 2 in December. That makes 2 issues.

The first issue for 1993 was Volume VI, Issue 1 (deja vu!) dated
April, actually released 2 months later, in mid-June.

So, obviously, developer news is not a current priority for Atari.
If I have overlooked any issues, please let me know.

From: gustavo@barkai.uchicago.edu
Message-ID: <1993Jul2.073107.11978@midway.uchicago.edu>
Source record: 37889

Hi, everybody. I'm experiencing a weird and maddening problem with my ST. Although the machine boots from floppy just fine, I can't get it to boot from the hard disk. This started happening after I tried to instal winx (a program that supposedly allows one to open a very large number of windows from the desktop). This thing was supposed to run from the auto folder, but it bombed, signalling the beginning of my woes: although I have removed the program from the auto folder, what the ST does now on bootup is to load everything in the auto folder, but once it is done, instead of exiting to the desktop it starts booting up again (and again, and again, ad infinitum). Does anyone have any idea of what could be going on? I'm at the end of my wits. I don't know what else to check. Any suggestion would be appreciated.

Gustavo

This was true. They relied on the Zilog SCC chip for I/O ports and timers.

> I think this situation has changed considerably. There are at least
> three solutions for the Mac which offer high-level Midi system
> services and hide underlying Midi hardware. I am referring to MIDI
> Manager/Midi Driver from Apple, OMS (Opcode MIDI System) and the forthcoming
> FreeMIDI System from Mark of the Unicorn which is under beta test and
> will be available also in source form.

I agree. This occurred to me several years ago when I first heard of the Apple MIDI Manager, which effectively decouples MIDI applications from the underlying hardware by providing an interface layer. And only the driver needs to be modified to adapt to different hardware.

Of course, for this to be useful, the MIDI applications must go thru the Manager layer, and at first it seemed uncertain whether the Mac developers would follow this approach (since there's a substantial performance penalty involved). But, apparently, most are offering it, at least as an option.

Unfortunately, I've never had enough free time to delve into this, although it seems to be emininently do-able, contingent on the ability to secure sufficient details on the low-level implementation of the driver code. I had no interest in trying to reverse engineer this from a disassembly listing, but the recent announcements regarding the FreeMidi System hold out some hope in this regard.

(Of the 3, FMS seems the best bet, since the others are proprietary, and the licensing fees for OMS are rather expensive.)

> It would be then extremely valuable to have an instance of a driver of
> this kind providing full Midi capabilities for Mac applications under
> Spectre.

Sounds good.

> Unfortunately, I have no programming experience on a Mac (or emulated
> Mac) and Dave Small does not seem too active at the moment.

I have programming experience on a Mac, as well as doing assembly-
level MIDI stuff on the Atari side (I'm a commercial Atari software
developer), so I can probably provide some input if you can get
your hands on the "details" and the driver source codes. But I
doubt I will have enough free time to be able to 'carry the ball'
on this project.

I suspect that the actual MIDI data I/O through the ports will not
be overly complicated, and the messy part will involve reprogram-
ming the MFP to provide SCC-compatible timing services.

Let me know if you obtain the driver sources, and keep me informed.

P.S. One problem that I think you may still run into, even after
resolving the MIDI interfacing issues, is that most (?) commercial
Mac MIDI applications use a copy protection scheme that require
you to have a real Mac floppy disk drive/controller. So you might
still not be able to run Mac MIDI apps, because the software
will not be able to recognize the master disk!

> to replace the defualt desktop. This does not work totally. What I get

Your analysis that the desktop icons are contained in the desktop's object tree, and therefore not drawn in your tree, are correct. W_NEWDESK is not the solution you're looking for.

There are only 2 ways to accomplish this, that I can think of, and both are messy (maybe there are other ways that I can't think of?).

The first way would involve patching information into the desktop's object tree structure, either to change the BOX attributes or convert it to a G_PROGDEF for more flexibility. There are 2 problems: one is in locating the structure, the other is in modifying memory that you don't own under MultiTOS.

The other involves trapping the VDI area fill call, that you described in your article. This seems to me to be a "safer" approach.

I'm sorry I can't be more help. I believe a similar question was asked recently on GEnie, and the Atari response was "there's no legal way". Maybe Eric will jump in with better information.

I'm not sure the ELS series has a parity disable jumper. You
might want to check that first. ICD's newer AdSCSI host adaptors
will handle parity enabled just fine.

********** STAR NX1000C Drivers... **********

Hi I have this Colour Printer A STAR NX1000C I think its also called by another name, (NL10C)..??

But I would like to find some Colour Drivers for it, for say 1stw+, Degas, and what ever..

This is not my Printer but I am trying to help some one that was sold this by a Bad Atari dealer, with out No Support at all, but that was some years back, it has never worked with the Atari al all...

Thanks....

Roger.............. sheppard_r@kosmos.wcc.govt.nz

3547. 520ST and SVGA-monitor?

Newsgroup: comp.sys.atari.st.tech

Hi,

I will be getting my old not-so-faithfull Atari 520ST back.
I used to have an old Philips-color-monitor to connect it to.
But no more. I now have a cheap PC-clone with a SVGA-color
monitor. So...

Is there a way getting color images on a regular (cheap)
multisync-color-monitor.

Also possible wiring scheme would be helpful.

-Anton

3548. GCC installation probs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-02 13:18:06 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <C9JGy7.LC1@dcs.qmw.ac.uk>
Source record: 37797

I think this was answered recently in a thread that I only caught the tail-end of, so appologies for asking again, but:

I'm trying to get GCC up and running on my Falcon, and so far I've downloaded the binaries for v2.4.4 from the umich mirror at src.doc.ic.ac.uk, along with gas, utils, gnulib, gemlib, patch and the last few updates. I've un-zooed them all and set up various environment variables as described in (I think) gcc-brief.doc that I found somewhere. I'm using the Gulam CLI. The problem is that when I try to compile a simple "hello" prog
(ie void main (void) {printf("hello\n");}) gcc-ld complains about an "unknown symbol ___main referenced in text".
Any help appreciated. BTW, is there an "idiots guide to getting GCC onto your Atari" or similar FAQ anywhere?

Thanks.

Winx only works on German ROMs. If you want lotsawindows, use MTOS!

Your hard disk - have you checked the FATs and directories to make
sure they're OK?

In reference to the article above, I want to thank those who
responded by e-mail. The problem has been found: it was a desk
accesory that was causing trouble (AUTORAIS.ACC). Incidentally, has
anyone gotten this to work? Perhaps I'm missing an .RSC file?

i am trying to install a mega20 on a 1040st.

i don't seem to be able to get the "C:" icon properly configured.

when i reboot the icon does not come back, yet it seems to have been
written okay into 'desktop.inf'.

also, the manual that i have is for a "SH Hard Disk Drive" (atari) and
the driver util floppy is marked "Advanced" HDI utils. i am not sure
that all of this stuff actually should play together.

any suggestions would be welcome.

thank you,

loren

Works fine for me (on my TT -- hey, that rhymes! :-). It doesn't need an .RSC file. The .ACC might just be corrupted; replace it.

3553. Help! My ST is going insane

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-02 21:04:48 UTC
From: elvis@watserv.ucr.edu
Message-ID: <33607@galaxy.ucr.edu>
Source record: 37802
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
My ST seems to be exhibiting some strange behavior these days, and I was wondering if anyone out there has some suggestions as to what might be the cause. The first (and older) symptom is that every so often when I move the mouse, one of a few keys will start to auto-repeat (generally ESC, 1 or 3). My ST also tends to think that the Shift or Alt key is still being held down after I let go. I think these may have to do with the D.E.K.A. setup I'm using, but unfortunately I don't have the option of using the old keyboard, seeing as my ST is in a tower case now. So I thought I would check if there was another known cause.
The other problem is that when I exit a program back to the regular desktop the number of windows that opens (for directories) is always one less than the number I went into the program with. I.e. if I go in with three directories showing, only two will open up when I exit the program. It doesn't do this with NeoDesk, but on occasion I need to work from the built in Desktop (TOS 1.4). It doesn't seem to do this if I boot off the floppy, but does anytime after the hard drive has come up to speed (even if I hold down Shift-Ctrl-Alt to go to the floppy instead), even when I have no auto boot programs. Could the boot program for my Supra drive interface be messed up? My machine also seems to crash a lot more now then it used to, so I'm wondering if this is the most visible symptom of a deeper cause.
Any help would be appreciated.

3554. Minixfs pl5 source available ...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-02 22:04:14 UTC
From: shenson@nyx.cs.du.edu
Message-ID: <1993Jul2.220414.7522@mnemosyne.cs.du.edu>
Source record: 37801
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just sent Minixfs pl5 to atari.archive and ftp.uni-muenster.de . Several
bugs have been fixed as well as a few new features. It should now work with
Falcon IDE/TT SCSI drives with huge partitions (though this isn't tested by
me because I haven't got the things!). An asynchronous updater has been added,
it should speed things up quite a lot. It also compiles now under mintlib pl32:
I've replaced all the gratuitious typedefs !
Read the file docs/pl5.doc for more info.
I've also made the 'copying' restrictions a bit tighter. Nothing drastic
just no commercial use without permission and no binary redistribution (if you
can't compile it then leave it alone!).
Also I've given details of the ICD software problem with a small test
program. Hopefully this will clarify the problem. If someone with ICD boot
after 6.0.6 would try this program and see if the bug is still present I'd
be grateful.
Steve.

3555. GNU-C++ : double defined symbol ___main

Newsgroup: comp.sys.atari.st.tech

Groetje!

This is cause by the G++ lib modul gnulib3. I recompiled gnulib3.c with
the option -DNO_GNULIB3 and replaced the one in the g++.olb with this.
It seems to work fine now .... but I'm just getting starting with C++,
so watch out ;). (btw, __main is defined in gcclib2.c in the mlibs pl32).

If anyone thinks this is wrong please DO correct me.

I have just read that Motorola will deliver the first 68060 to selected
customers. I dont have any info on this chip, other than

1. Like the Pentium it uses Superscalar technology
2. Internal FPU
3. 8k Data and command cache.
4. there are/will be 50 & 60 Mhz versions
5. Atari wont use it until it out of date ;-)

3559. ST Monochrome Monitor (Goldstar)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-03 17:22:58 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.ea.6aDddbiWUgI@semprini.tdkcs.waterloo.on.ca>
Source record: 37812

After ignoring all of the "My monitor died! HELP!" posts for years, I have to make one (isn't that the way it always works?)...

I was sitting here, minding my own business, reading news. Suddenly, I notice that the characters on the left side of my screen are getting WIDER, and they're starting to look like ST LOW characters. The characters on the right side of my screen are getting thinner, starting to look like a 6x18 or 4x18 font.

Mere seconds after I noticed this, there was a crack noise, the picture shrunk down to nothing (much like when you shut off the monitor while the computer is still on), and there was a phhhhhhhhhh noise (like when you open a can of pop) that went on for several seconds. Then I noticed this major stink like burning peanut butter.

I unhooked my mono monitor, and plugged in the colour, which has only been used for games for the past several years. :-(Quite a difference in screen quality.

What I want to know is:

a) What happened? I know the Atari mono monitors have a reputation of dying (this one is about 5.5 years old)....
b) Should I bother trying to find someone to fix it?

Buying a new one isn't really an option; the closest shop that stocks (highly overpriced) Atari hardware is about an hour's drive away and I don't have access to a car. Besides, I only paid $100 Cdn for this monitor in the first place...

Thanks in advance for any "Yup, that's exactly what my monitor did!" or other helpful posts/email. You should probably email, I imagine everyone is sick of seeing these (Steve should add this to the hardware FAQ!).

But on the plus side non-Atari High-Res monitors are ow available from a
number of companies. They take a mono SVGA, make a few hardware
modifications and bobs your uncle. Erm, Systems Solutions, Ladbrokes
and Gasteiner are all doing this - it might be worth your while
phoning around.

Does anyone have UNIX-like telnet, FTP, telnetd, finger, etc. programs for MiNT that will work with a SLIP connection (a la ka9q)? I realize I can *get* all of these services through ka9q packages, but I was wondering if anyone had hacked up seperate programs that can be used from the shell, like in UNIX. Especially I'm interested in a telnet daemon that will allow users to connect to my machine remotely and log into my multi-MiNT setup.

I am planning on doing these programs myself if I can't find any already written as stand-alone programs. It should not be too difficult to take the ka9q source and make these programs, but ti would save a lot of time if someone had already written some of these utilities.

Thanks in advance.

This .sig is $hareware. If you use it for more than a

If you don't get a C icon when rebooting, then the system did not see
the hard drive. Run HINSTALL. If that fails to resolve the problem,
then check your cabling or go visit a repair center.

Source record: 37822

> Upgrade Falcon HD

The IDE drives in the Falcons are 100% industry-standard IDE, needing no special adaptors or anything. (Kind of amazing, when you consider Atari's history of disk interfaces!)

As long as you have a way/place to mount your 3.5" IDE drive inside the tower case, you can just plug a standard IDE cable from the drive to the IDE connector on the Falcon motherboard; no other hookup is needed.

3571. Going out of town, HSC/GemFast support delayed

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-04 22:36:19 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Jul4.223619.18615@mnemosyne.cs.du.edu>
Source record: 37823

FYI, I have to go to the San Francisco area for a couple weeks on a programming contract. I have no idea whether I'll be able to arrange net access while I'm out there. Mail to me here bounces to my BIX address automatically, and BIX will throw away any mail I don't read after two weeks. So, if you send me mail and don't get a reply, try sending it again in a couple weeks.

This trip will also delay release of HSC 2.0 and GemFast 1.9 for at least two weeks. (But on the other hand, it pays good $$$, which I desperately need!) Another plus is that I'm gonna be right near Sunnyvale, and might even find time to stop in at Atari and say hi to folks there who I know only as a voice on the phone.

3573. Shells, Unixmode and Mint??

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-05 00:12:16 UTC
From: jhoffman@netcom.com
Message-ID: <jhoffmanC9o0KH.Gx1@netcom.com>
Source record: 37825

I'm having an awful time trying for figure out how to setup my ST with a good shell and a compatable set of file utilites that all run under mint. I've gotten MintBash off a.a. I also downloaded the file utils in the gnustuff tos directory. I seem to generally have things working except that bash wants to load .bash_login at startup. Obviously, .bash_login doesn't fit the Tos filesystem. I read about unixmode somewhere and assume this is what is happening. So I used elvis to edit a file called .bash_login this created the file .bas that I see with ls. BTW I'm running mint .95 and loading bash straight from the mint.cnf file.

The main problem is that BASH also uses the file .bash_history to put history in. It looks like bash is puting this in the .bas file.
I take this to mean that bash isn't using unixmode to handle the file system access. Even if it did I don't know if it would work with all the utilities and applications consistantly...

I like the idea of unixmode but is there a collection of utilities and shells that support it? Is it compatable with mint?

After I get all this going I still want to get gcc and g++ setup and working. seems like I'm hitting snags even before getting to the gcc.

Does Ksh work with Mint, etc better than bash? I'm quite a ksh & bash fan so I haven't even looked at tcsh...

Help appriciated.

Not completely true. A 2.5" HD has a different connector from a 3.5", namely that the power is carred w/ the ribbon connector, and not w/ a separate cable. You need to split the power off from the MB connector, and plug it into the standard power slot. Not Atari's fault, that's the standard.

Hi, everybody!
I've been triying to run FOLDRXXX.PRG from my auto folder, but whenever I do, I get the message "Can't find file FOLDRnnn.PRG. Press any key to exit ". What's going on? Am I supposed to have some such file sitting in the auto folder (or elsewhere)? Any help would be appreciated. In case this information helps, I'm booting up from hard disk using an ICD drive controller and ICDBOOT.PRG. I know that this software allows one to set up a certain number of extra folders, but this eats up RAM. I don't know, maybe there is some incompatibility between ICDBOOT and FOLDRXXX. Would anyone care to comment?

Thanks in advance

Gustavo

```
You should rename FOLDERXXX.PRG to FOLEDER256.PRG or and other number.
The XXX indicates the number of additional folder entries in TOS's
internal
table.
I am not sure if this is still needed will TOS versions > 1.04 or with
MultiTOS.

3578. Falcon DSP/sound questions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-05 08:21:18 UTC
From: steve@wan.inf.rl.ac.uk
Message-ID: <13741@hardy.rl.ac.uk>
Source record: 37832

I've read Atari DocSupport VI but it leaves much unsaid about the DSP/sound system. I'd be grateful for answers to any of the following questions:

(1) What is the bandwidth of host port DSP transfers with the XBIOS block transfer routines? what about hitting the hardware directly?

(2) How do you access the sound DMA system form the DSP side?

(3) Can the XBIOS DSP routines be called from interrupt routines; how long to they take? do they shut out high priority interrupts such as MIDI/IKBD?

(4) Where/how is the DSP host port & sound DMA mapped into 68k address space?

(5) What 68k interrupts are triggered by the DSP host port tx_empty and rx_full conditions?

(6) How should user DSP programs (as opposed to subroutines) terminate cleanly? (rti, swi, infinite loop?)

Steven

3579. Sample replay with Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-05 08:22:38 UTC
From: steve@wan.inf.rl.ac.uk
Message-ID: <13742@hardy.rl.ac.uk>
Source record: 37833

I wish to replay samples over the falcons DSP/sound system at different pitches, i.e. I want to use my falcon as a sampler. Now to change the pitch of a sample while keeping the reconstruction frequency at 50KHz I can do several things:
(1) Decimation using a DDA to step through the sample
(2) Linear interpolation
(3) Higher order interpolation

Now on pre-falcon Ataris, (1) is typically used since (2) and (3) require the use of multiplies which the 68k line can't to fast enough for real time. Now ideally I would like to use (2) or (3) to reduce the reconstruction noise and do all the computation on the DSP. This runs into a small snag: A typical sample may be 5-10sec long at 16bits * 50Khz = 0.5-1Mb. This won't fit into DSP ram so it will have to be held in main ram. But the DSP doesn't have random access to main ram! I've though of several arrangements

(1) Pump the sample data through the sound DMA, approximating the required frequency by changing the transmission frequency and the number of channels used. The DSP then corrects the pitch as required.
CONS: Since the inflow of data through the sound DMA won't precisely match the rate require for the interpolation, the dsp will have to some buffering which will limit the length of samples. Also no polyphony will be possible.

(2) Simulate DSP random access to main memory using the XBIOS dsp interrupt mechanism.
CONS: possibly too slow (1 transmit and recieve interrupt per sample), burns a hell of a lot of 68k cycles, still only monophonic

(3) Simulate DSP random access to main memory by hitting the DSP host port hardware directly.
CONS: As for (2) but no so slow; also Atari don't document the host port.

(4) Ditch the DSP and just use the 68k to do decimation.
CONS: Burns 68k cycles, more reconstruction noise, what the hell is the DSP for andway?

Does anyone have any better ideas? The only sample player I've seen for the falcon takes over the system completely so I would guess it is doing (4); hardly the behaviour of a nice MultiTos compatible program...

Date: 1993-07-05 08:31:14 UTC
From: steve@wan.inf.rl.ac.uk
Message-ID: <13743@hardy.rl.ac.uk>
Source record: 37835

How should a balanced mic (hot,cold,ground) be wired to the Falcon mic input?
Alternatively how shoud the line outs of my mixer (which has balanced mic inputs)
be wired to the Falcon mic input? - I don't want to burn the codec!
Also can the headphone out drive a mixer line input?

And finally (bonus question!), if the Falcon is aimed at the music industry why
didn't Atari provide line level analog i/o, like every other piece of MIDI kit?

3583. IDE drives in F030

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-05 11:47:12 UTC
From: molin@ptb.cl.msu.edu
Message-ID: <2194c0$hbq@msuinfo.cl.msu.edu>
Source record: 37838

Is it just my system or what? I can't recall seeing a hard drive work so slow since the SH204 days... Loading PageStream on a stock ST (using a Supra/Quantum combo) takes a matter of seconds. Loading PageStream on a F030 takes EASILY 10 time longer (although I haven't timed it, to be fair) The F030 drive light blinks on, then off, then on, then off for awhile, then on, then off ad infinitum.

IDE drives are supposed to be known for their speed, or so I understood. Is this a problem with HDX/AHDI?

FOLDRXXX is gonna eat up just as much memory as the folder setting in
ICDBOOT. Probably what's looking so memory hungry to you is all the
OTHER settings in ICDBOOT. With all the enhancements allowed, comes
the cost of RAM...

You should DEFINITELY use a folder fix program of some sort with TOS 1.04,
however it should be considered a configuration setting rather than a bug
fix.

Atari did not ship the Falcons with FOLDRXXX so I'm presuming that TOS >
3.06 doesn't require it. Running MultiTOS on a non-Falcon machine, it
seems to me you'd be better off using it since the underlying machine
may still require it.

This is something I've been meaning to ask.. in the non-HD Falcon are the IDE connections all still available? For the price differential (2-300UKP) I could get a damn sight bigger internal IDE than 65MBs.

Is the non-HD Falcon available in any part of the World yet?

Sounds to me like a hardware problem.

>IDE drives are supposed to be known for their speed, or so I understood.
What? Good joke, I'd say. IDE drives may be faster when loading small blocks
of data. Normally SCSI drives are considerably faster than IDE drives. A
SCSI drive on the TT is about as twice as fast as an IDE drive connected to
the F030. On the F030 SCSI drives are much faster than IDE, too.

NVDI is a bit faster than Warp9, but seems more compatible than Warp9. It
also provides a GDOS replacement which is _much_ faster than GDOS 1.1.

A lot of people just cut the lead to the internal speaker, it's very annoying if you are - for instance - playing a game and you can't turn the sound down with the CPX thing.

Mail 'ssolutions@cix.compulink.co.uk' who will be more than happy to sell you a copy of NVDI (and, obviously, tell you all about it). From my personal experience NVDI is *very* much better than QuickST, etc. Using a good benchmark program (such as Ofir Gal's excellent 'Gem Bench') it is clear that NVDI is very much faster. It is also - apparently - more compatible, works with MTOS, is Falcon compatible and includes a very fast GDOS replacement.

3595. Bounced Mail, Faclon Audio I/O

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-05 18:38:51 UTC
From: cmh@eng.cam.ac.uk
Message-ID: <1993Jul5.183851.19672@eng.cam.ac.uk>
Source record: 37750

Tried to email this, but it bounced...

In comp.sys.atari.st.tech you write:

>How should a balanced mic (hot,cold,ground) be wired to the Falcon mic input?

Assuming the mic does not require Phantom Power (if you haven't heard of
it then it doesn't ;-), then make an adapter with a female XLR one end,
and a minijack (MJ) the other. Wire XLR-hot to MJ-tip and MJ-ring,
and both XLR-cold and XLR-earth to MJ-sleeve.

>Alternatively how shoud the line outs of my mixer (which has balanced mic inputs)
>be wired to the Falcon mic input? - I don't want to burn the codec!

Yes, but you would need to make a little attenuator out of some resistors
to avoid it distorting. You shouldn't damage the CODEC whatever you do.

>Also can the headphone out drive a mixer line input?

I would think so.

>And finally (bonus question!), if the Falcon is aimed at the music industry
>why didn't Atari provide line level analog i/o, like every other piece of
>MIDI kit?

F***ed if I know, but from what I've heard the analogue I/O is not really
up to anything more than recording and replaying sampled sound effects for
games. It certainly isn't good enough for any professional studio.

Just use the General Setup CPX, there's a button there for turning the speaker on and off. I think it toggles one of the previously unused Yamaha port bits, don't remember which tho.

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <21a4e1INN7ml@golem.wcc.govt.nz>
Source record: 37752

A plea to anyone who has installed, or knows about installing, the Overscan (as seen in overscan.arc etc. on atari-archive, the PD version!). On an STFM-Revision D (Or compatible) motherboard....

I have all the parts, the only thing I'm unsure of, is which trace on the mother-board I'm supposed to cut. If I chop up the wrong one, I doubt it'd do the machine much good! (Routing 20Volts to the Eproms wouldn't do them any good that's for sure!)

So, if anyone can tell me, (or show me via a pic' file of some sort, even better!). I'd really appreciate it, as otherwise I've got $5 of parts which are no use to me! (Not much but, money is money!)

HELP!

It might help if you mentioned the versions of Minixfs. 0.60 pl5 is the latest
and is source only. Basically if you can't recompile it you shouldn't touch it
until it's been tested more. It's on a.a.u.e .

This is a common misunderstanding. A blitter is not much quicker that a few well
place movems. After all that effort you might get 10% performance increase if
you are lucky. On a TT and TT ram you'd probably make it slower.
Steve.

It certainly isn't up to pro-audio quality. It is much more than suitable
for games, comparable to a low to mid price domestic CD player.

True. It is still advisable to use the pool fix, because you might
run out of buffer slots. You will know when your system freezes
with something like 'Out of pool buffers; use foldrxxx to get more'.

Marc

I don't think it would be worth the trouble. On a lowly 8 MHz ST, the
processor can move blocks of memory at 13.5 Mb/s. The blitter could
be a little faster because it doesn't have to fetch command opcodes
in-between, but on the other hand, you have to set it up before
the transfer which for smaller blocks more than weighs off the speed
gains. On a 68030 system, the processor could even hold the copy
loop in its cache, and the blitter would probably have no
advantage whatsoever! The blitter really excels at transfers that
are not word- or even byte-aligned, but RAM disk data are always
word-aligned.

> Has MultiTOS been released? I mean can I buy it from the local dealer (US).

I don't know about the US situation, but MultiTOS has been available
here in Germany for quite some time now.

FoldrXXX extends the GEMDOS memory pool. Each call to Malloc() needs a few bytes from this pool, so if you have programs which do a LOT of calls to Malloc() (not malloc()), you'll have to install it (older version of the PureC linker for example). No matter which ROM TOS you are using.

>--

All the Falcons I have seen (that's three different ones) have had the 65MB
IDE drive in them and they're a far cry from an SH204. In fact, I've been
impressed by the speed of the internal drive, and as far as I can tell it's
just as fast as all the Atari hard drives I've seen (how's that for an
objective fact-based comment? :-) Anyway, on my 520 STFM I have a
Seagate ST157 and I only manage about 500 K/sec from it, so anything above
that seems screamingly fast to me.

More Falcon reltated, the programs I've been running on the Falcons I've
used have never demonstrated any slowness in disk access, although some
of them rebooted somewhere between excruciatingly slow and speeding
along more like a TT. Who knows what may cause the difference, perhaps
I'll be able to figure it out once I get my own Falcon...

From: pcxkrm@unicorn.nott.ac.uk
Message-ID: <1993Jul6.151355.3918@cs.nott.ac.uk>
Source record: 37762

Can anyone tell me how much memory MultiTOS uses relative to a MiNT 1.04 / TOSWIN setup? - I'm wondering if it is worth buying for a 4Mb STE system (yes, I know it will be slow, but presumably not that much slower than TOSWIN which I use at the moment...).

Also, is it possible to buy MultiTOS on it's own? - I'm not sure that I'd use the capabilities of SpeedoGDOS all that much - AMCGDOS has always been enough...

Thanks,
Keith.

Sounds like a wierd acc, or possible corruption of your FATs, etc. In the
former case, boot from a floppy and rename all your accs so they don't load.
Also, reinstalling your hard disk driver is not a bad idea.

I highly recommend that you get a copy of Desk Manager or Super Boot and use
it with your hard disk. Also, there is the commercial program Xboot that
is supposed to be excellent. These programs all allow you to manage your
hard disk booting sequence, which really helps when an auto folder prg or
acc goes nuts. Also, you can define several configurations and select
them at boot time. Something like this really is a "must have" for any
ST w/hard disk setup. I personally use Desk Manager.

That irritates me as well !
I guess they reckoned that "normal" users would only plug a microphone
to the AD input, and "serious" users would buy a better AD system that
hooks onto the DSP port.

5.5 years is a pretty good run for any monitor (especially a $100Cdn one).
It sounds like your flyback bit the dust, but there is no way to really tell
without opening it up (WARNING: Monitors can hold a lethal charge for quite
some time, even when unplugged).

> b) Should I bother trying to find someone to fix it?

Probably not. Instead, keep an eye on the forsale posts in comp.sys.atari.st
and buy a used one in good shape. I have done this twice (both mono monitors
work great). I have bought lots of stuff via the net, and have yet to
be screwed (heck, we're all nice folks). I would expect to pay less than
$100 for an SM-124 in perfect shape (both of mine were $80).

> monitor in the first place...

A new SM-124 would not be bad, but the newest ST mono monitors are pretty
crappy, IMHO. The ones I have seen are stock mono VGA with no sound, not
the nice paper-white phosphor of the old SM-124's.

I can only confirm this by saying that Progate supply the program with their drives and insist on using it regardless of TOS version. Under 1.4 and higher the problem is less likely to hit, but it is still there. To be on the safe side I recommend adding at least 40 folders. The memory requirement is 132 bytes per folder.

>The main problem is that BASH also uses the file .bash_history to put
>history in. It looks like bash is puting this in the .bas file.

There is an easy solution to this:

Create a .bas file from scratch and set an environment variable
BASH_HISTORY in there.

Well, better scan the bash docs for the name of the env. variable
that holds the name of the history file and use THAT instead of
BASH_HISTORY if they differ! ;-)

Yeah, and you better use a name that does NOT begin with '.bas'
as the name of your history file!

GOOD NEWS!!!!!

My brother just informed me that he found out from one of his fellow Clarkson Engineering graduates who works for Commodore, that Commodore has chosen the RISC chip of future amigas! (drum roll please...) As many have speculated, it is the DEC Alpha! They are planning on announcing this at WOCA-NYC during Lew Eggerechts speech. Better yet they will be showing in a semi-private session the prototype Amiga-A with the Alpha (100Mhz) and the prototype new high-end AAA Chip set! (This computer is not due out until mid 1994, however) Expect truely blinding speed in this speed demon!!!!!

More details as I recieve them.

>possibilities.
>
> Any feedbacks will be more than welcome.

I don't exactly know what your problem is, but obviously your
power wiring is a bit weak. When I upgraded my ST, I've finally had
to get the power form the very source (the power supply) and have
two thick wires for both voltages (in clear, 4 wires: pin 1, 9, 22, 30)

This may not always be necessary, but it helps (it seems that the length
of the signal wires influences the power needs: the longer the wires, the
better the power source you need (not sure, just an impression))

Other potential problems:
- bad solder
- wrong wiring (it happens sometimes)
- short-cut
- resistors for all the signals (I don't know
how important they are, but ..)

Ah, but there is a machine I would love to own. But are you sure on the
speeds? I know that some of the AXP PCs will be semi-castrated down to
about 66MHz (altho, I think this is mostly the buss limitation: the
low ends seem to be ESIA buss, and higher ends will have who-knows-what?)

>Lew Eggerechts speech. Better yet they will be showing in a semi-private

And lets hope that in 1994 prices will drop. I think the AXP PC 150
is priced at $7000, diskless! (altho, I dont have the DEC brochure
here to quote directly from... and we all know DEC hikes prices up to
where no mere mortal can afford things...)

] Can anyone tell me how much memory MultiTOS uses relative to a MiNT
] 1.04 / TOSWIN setup? - I'm wondering if it is worth buying for a 4Mb
] STE system (yes, I know it will be slow, but presumably not that much
] slower than TOSWIN which I use at the moment...).

I had M-TOS, using MiNT v0.98 running on a 1meg STFM, with NO other
TSR's/ACC's of any sort, and after loading, I had 8k of RAM available!
(Not even enough for M-TOS to display a disk directory!)

Basically, it uses an entire meg of RAM, and at least 2meg of Hard-Drive
space for a decent setup! (All it's files + extras)

] My floppy drive can read a disk fine, but 50% of the time it comes up
] with a write error((Data on drive B may be damaged.....)).
]
] Is it time for a new floppy, or what.

1st, try a cleaning disk (probably about $5 from the local computer shop),
this will get any gunge off the heads.

If that doesn't work, try bending the metal plate at the base of the
drive just inside the door, upwards about a quarter centimetre, this
can fix this problem (did with mine, and no, it doesn't cause read/write
problems when the disks are used with other drives, at least not on the
few machines I've tried it on!).

If all else fails, the write head could actually be loose, or misaligned,
in which case you'll need to open up the machine, and make sure that
the screws (if any, some models don't have screws holding them in place),
aren't wobbly. And generally scoop the dust etc. out of it.

Strangely, when I had problems, I did not get the Out of... error.
My first inkling that something was wrong was bizarre had drive file
access problems. Had me very confused at the time because I also thought
the problem was a non-issue in 1.4.

I'd like to use my Wuztek "Omnimon" for both my STE and a Mac Centris so I need to build a cable. No one seems to know about a DB-25 multisync pinout which is what the monitor has.

I pulled off the "Omnimon" label and learned that the monitor is an Acer multiscan monitor.

The pinout in the Wuztek lists two pins called "analog on." Anyone know what these do or where to find a VGA or Centris cable for this beastie?

Thanks,

Steve Whitney

3627. Upgrading SS to DS (pc drive in SF314 shell) HELP!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-07 02:25:38 UTC
From: mayfiej@ucunix.san.uc.edu
Message-ID: <21dc72$dfo@ucunix.san.uc.edu>
Source record: 37783

The situation: Long ago I bought an Atari 520STfm (SS drive, 520k). I also
bought an SF314 DS/DD external drive. I switched the DS drive with the SS drivethat was
built-in to the computer so that I could boot DS disks. This worked
fine. The SS drive burnt up, though... it likes to write BAD tracks on the disks,
eventually- ones that leave the disk permanantly damaged. I figured I'd just
get an internal 3.5" drive at a PC shop and slip it in the ol' SF314 case. Well, it FITS,
but the computer won't boot up when the drive's connected... if I put the old one back in,
everything's fine. But this new one- even if it's not
switched on- just won't allow the system to work. It is a Chinon drive (the same company
that made the drive that's now inside my ST). Earlier today, I
even bought an HD 3.5 drive, and it did the same thing, but I took it back cuz
I thought the fact that it was HD was causing my problem.
1.Why doesn't this new drive work?
2.How can I fix it?
Thanks.

It seems to me rather meaningless to say that NVDI is "faster" than program X,
faster at doing what? What does NVDI speed up? If it is simply a VDI
replacement and therefore speeds up VDI calls only, then it is totally
different than other system speeders and comparing them is meaningless. If
it does more than speed up VDI calls, then it's badly named. :}

It may also help if you connect two 0.1uF capacitors on the expansion
borad, one between pins 1 & 9, the other between 22 and 30. This lowers
the impedance of the power supply at high frequencies, as does using
short thick wires instead of long thin ones.

Of course it's possible. All you need is a hard disk driver which supports these drives (I know at least two: ICD's software and HuSHI, the driver sold by Hard&Soft, Germany).

Dito }-). While TOS 1.04 fixes quite a few problems with the handling
of the internal static GEMDOS data area and is generally more
efficient in using it, the internal GEMDOS memory is still limited!
Normally, you won't ever reach these limits, but there are situations
where may still bump into them. This is especially true if you're
using large program packages such as TeX, NetNews readers or other
programs that either allocate a lot of memory in small chunks or
hold a lot of open files or both. If I remember this right, the dev docs
make this quite clear. And if you still think that FOLDRxxx is
no longer needed for TOS 1.04, try searching for the string
'FOLDR' in your ROMs ...

Julian is absolutely correct. You can save yourself a few headaches by buying a complete unit with drive, power supply, cable, interface and cartridge from either TOAD Computers or Purple Mountain Computers. There may be others who have similar packages but these are all I know of at this time. If you find a good deal on the hardware, it's easy to assemble your own as long as you get the interface and driver software from ICD or HuSHI.

>buy Falcon without HD, tower case and 3.5" IDE hard drive.

Not a good idea.

Two reasons:

- The drive in the Falcon is cheap, (German prices ahead) for DM 400 you'll
get an 84 meg drive, MultiTOS and SpeedoGDOS (these two are DM 198 if
bought separately.

- 2,5" IDE drives are not at all cheap if bought separately.

bye, Peter

>awhile, then on, then off ad infinitum.

This is a PageStream problem. All others load very fast.

btw, the Falcon's 84 meg drive reads about 850 KB/s and writes about 500 KB/s,
whereas the old SH204 was 250 KB/s and 110 KB/s...

Hopefully it's a joke since Alpha would be a horrible chip to use
from a cost, multiple vendor and heat dissapation point of view. If
they are going to RISC MIPS would probably be the best from a cost,
multiple vendor and heat point of view. The 3000 line can run pretty
fast and the chips are dirt cheep, < $50.00 per, in quantity. That
would seem to be more in C='s price range than an Alpha or PowerPC
at a couple hundred a pop.

NVDI replaces the VDI but also speeds up BIOS and GEMDOS screen output.
It is visibly faster than Warp9 which can be confirmed by using
benchmarks. I don't think this is meaningless.

I don't think this is possible, but I have written a program sequencer that will let you do exactly that and more. It has a GEM front-end to create batch file which can run GEM or TOS programs and pass them multiple parameters. Anyone who is interested, could mail me.
The program is still under dev but it does work, I had no bugs reported from beta-testers. The program is shareware.

The ICD Pro Utilities, which is the version they're now selling separately and with the Link should be able to handle the IDE drive in the Falcon. I'm not sure whether they've updated the RateHD program with the rest of the utilities to work on the internal drives -- perhaps they just did the necessary ones to start with.

At any rate, get the Pro utilities from ICD if you don't yet have them, they're more Falcon-friendly... :)

From: jmw@tasman.cc.utas.edu.au
Message-ID: <jmw.742104744@tasman>
Source record: 37708

Atari, are you there? Here is how to treat your prospective developers.
I went to a CAUSE conference where I attended a talk on Windows NT (which
I thought looked very good, but that's another story). From discussions
which took place at that talk I learned of the Win32SDK CD-ROM. This
is a developers kit for NT. It costs $125 Australian and includes a beta
release of Windows NT. I have just placed
an order for it via fax. I could have also (but chose not to just at the
moment) joined Communique ($40 Australian) which is a monthly developer's
news letter and provides access to a 008 (ie free call) number.

Contrast this against my efforts to get a response of any kind out of
Atari Australia. I have spoken to them on the phone, and sent a letter
requesting details about the developer program. The attitude was 'we
don't want too many developers working on the same thing'. That was all
three months ago, and I'm still waiting to find out if I qualify for
any level of developer support at all.

Atari please get it together before it is too late.

words, there's too many good ideas for the company to handle 8-)

3667. Atari Developer CD ROM coming soon.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-08 07:36:39 UTC
From: wilsont@rahul.net
Message-ID: <C9u554.Jwr@rahul.net>
Source record: 37711

I'll try to get the whole article posted here, (it'll probably be in AEO anyways...) heres a summary till then.

Atari wants developer contributions to put on a CD-ROM they will release the day before the glendale show at a 'reasonable' cost. (no price given)

The Atari developer kit files will be on there, MTOS, Works, sample code etc etc, if you think you have some stuff every developer should see, or if you want to put a special encrypted demo version of a compiler or programmer utility on it, you can also do that.

Deadlines are in august(7th?).

Like I said, i'll try to post it here. (I need permission)

NVDI is a _complete_ VDI replacement plus an build-in GDOS; as Quick-ST etc.
are also screen accelerators (at least partly), a comparison _does_ make
sense (at least of the screen accelerating parts). And in this light, NVDI
is a lot fasterthan the other programs. And there is another special point:
IO-redirection works without any problem under NVDI, even with the first
version.

Hello,

I am having some trouble with MultiTOS. Beside the numberous crashes and
incompatibility problems (switching from TT-MED to ST-High) the main problem
is the XCONTROL.ACC. It is version 1.00 and I was wondering if there is
a newer version around somewhere. This one leaves the mous in the busy
state and does not allways have a correct layout.

And then, is there an editor to edit the new deskcicn.rsc file?

Thanx

Marcel.

Huh? As I understood it the 40-folder problem and the pool fix problem are completely separate and have nothing to do with each other? They are solved independently by separate patch programs?

They stopped manufacturing one of the chips for the unit. I heard from someone that the reason they did so was that the product was picking up more than just weather signals.

Or could be used to pick up more than just weather signals.

It was called WEFAX. I still have a couple of the chips though, but I never did put the thing together and try it out. Maybe I will some day...

3677. Gnu Lib vs Mint Libs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-08 19:07:18 UTC
From: jhoffman@netcom.com
Message-ID: <jhoffmanC9v146.1ts@netcom.com>
Source record: 37720

I have another question. What is the difference between mintlibs and the regular gnulibs (Tos based I presume). If I just want to write software to run on TOS based systems can I use the mintlibs??

I finally got my mint/bash/unixmode problems all resolved. I ended up using mint aware BASH 1.05. This older version uses bash.rc instead of .bashrc as a startup file.

As a few other people have mentioned I'm also getting the ___main not found error message when compiling the simple hello world prog.. I've used both PL 85 and 87 libs and includes. Someone mentioned that PL 88 fixes the problem. Where would I find these libs? They don't appear on any of the ftp sites I've checked.

Thanks,
John

3678. 11 bombs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-08 19:37:32 UTC
From: Geoffrey Spear <gspear+@CMU.EDU>
Message-ID: <UgD7Rwa00YUn4UyFBd@andrew.cmu.edu>
Source record: 37721

Does anyone know what 11 bombs means? (A full list of bomb meanings would be useful, too, if anyone has one they can post)

I am running multi-MiNT. Yesterday I created 2 accounts on my system (the first 2 non-system accounts). Mine is user #4, a friend of mine is user #5. I can log in as him, or as root. If I try to log in as me, I type my username at the login: prompt and I get 11 bombs (I have no password, by the way. Neither does my friend). I created as guest account as user#6, and trying to log in as guest produces the same results. As far as I can tell, our accounts are set up identically (I even copied all of his files to my directory), and our /etc/passwd entries are identical except for user ID, username, and user #.

This .sig is $hareware. If you use it for more than a
month, send me all of your money, then see a
psychologist. Or kill me.

3683. Atari Developer CD ROM info.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-09 06:04:33 UTC
From: wilsont@rahul.net
Message-ID: <C9vvJM.EDw@rahul.net>
Source record: 37736

From: Mike Fulton, Atari Developer Support

To: Atari Developer Community & Atari Programmers everywhere

This file can be freely distrubted, as long as it remains INTACT, and
unedited, and in its entirety.

Atari Developer CDROM

Atari is currently in the production stages of creating a Developer
CDROM disc that will be offered to both new and existing developers.

The initial release is slated for the developer conference that is going
to be held on Friday, September 17, 1993 in Glendale, California, the
day before "Atari Computer Faire, Version 7.0" starts (AKA "The Glendale
Show").

Once the initial version of the disc has been released, we expect to
have updates a couple of times a year with new material and any
necessary corrections. Once you've purchased the disc, you'll be able
to get the upgrade discs at reduced cost. (Exact pricing information
for the disc and/or updates is not available at this time, but it
should be pretty reasonable.)

Since not all developers will already be using a CDROM drive with their
system, we plan to include a floppy disk that will have the necessary
CDROM driver software to allow them to access the disc once they have
connected a CDROM drive to their computer.

==========

Here's a preliminary outline of what we hope to include on the disc:
(This is still preliminary subject to change without notice, of course!)

==========

* All of the current versions of all of the programs and files in the
Atari developer's kit, plus additional related items not included in
the regular kit.

* Atari Falcon030-specific developer's tools such as the DSP
Assembler, Linker, and Debugger

* Current release of SpeedoGDOS outline font scaler

* Current release of MultiTOS multitasking operating system

* Atari Works -- integrated word processor, spreadsheet, database

* Programs that currently ship with Atari computers such as the Falcon030 (but which work with older machines) that not everybody may have, such as:

CalAppt -- Calendar/Appointment Book/Address Book

Procalc -- Calculator Accessory (with number-base conversions)

Talking Clock -- STE/TT/Falcon030 Talking Clock Program/accessory

Accessory Games -- Breakout, Landmine

Audio Fun Machine -- Assign sounds to keystrokes & system events on STE/TT/Falcon030

* Online Documentation -- The disc contents will be described in an online hypertext format. Additionally, at least some of the regular developer's documentation will also be available in hypertext format. (With more to come on future updates.)

Imagine being able to look at a function reference of all the functions described in the GEMDOS manual. You click on "Fsfirst()" and get a description of that function. While you're looking at that, you start to wonder what the rules for legal filenames are, so you click on "Filename" and see a description of what constitutes a legal filename.

* Demo programs -- graphics demos, sound demos, etc. For all machines, especially the new Atari Falcon030.

* Sample source code -- for new TOS features, from past developer newsletters, and so on.

==========

Aside from all of the above, there are three additional categories of files that we would like to include. These categories all depend to a large degree on submissions from the Atari Developer community.

==========

* Public-domain & shareware development tools, utilities, & source code.

We would like to include as much public domain and shareware stuff as we can. We want development tools, utilties, sample source code, and anything else that is programming-related. For example, we would like to include things like the GNU GCC compiler (C & C++) and other GNU tools, and possibly other PD or shareware compilers as well.

We would like to include just about any kind of developer oriented program, but we do have a few basic guidelines about the submissions that we would like to follow:

1) The software should be compatible with both SpeedoGDOS and MultiTOS. By 'compatible' I mean it doesn't crash or mess up the display in some fashion. Taking advantage of either SpeedoGDOS or MultiTOS is not required, although it is certainly welcome.

If you have something that you might like to submit, and you aren't sure how it behaves with SpeedoGDOS or MultiTOS, please just go ahead and submit it. We will be testing submissions as much as possible before including them. Include information for any compatibility problems you already know about.

If you know for a fact that your submission doesn't work with SpeedoGDOS and/or MultiTOS, but feel that other developers will still find it quite useful, then let us know about it and perhaps we'll make an exception here and there (pun absolutely intended! ;^).

In most cases, incompatibility problems with SpeedoGDOS and MultiTOS are easy to fix, because they are usally caused by one of a small handfull of programming errors. If you make your submission, it may be the case that we can point out what's wrong and you will be able to fix it without too much trouble.

One problem that some programs have regarding MultiTOS is that they don't do their console & screen I/O in a consistent manner. They mix up BIOS, GEMDOS and GEM calls all together. For example, they might use Bconin() to get keyboard input and then they'll use v_gtext() to output information to the screen. Or they'll use evnt_keybd() or evnt_multi() to get their input, and then use Bconout() or Cconws() or some other such BIOS or GEMDOS call to do their screen I/O.

This doesn't work too well with MultiTOS where programs generally don't own the whole system and have to share the keyboard and display screen with other programs.

If you're going to do be a GEM program, then you should do all of your screen & console I/O through GEM. If you're not a GEM program, then you should do all of your console & screen I/O through the BIOS and GEMDOS. Pick one or the other and stick with it.

2) The submission should have at least minimal documentation, preferably in English. If complete documentation is only available in another language, then we'll have to judge how difficult the program is to figure out and use without documentation.

Submission Guidelines
---

* If something is clearly marked as being public domain, you do not have to be the author to submit it.

* On files marked "Public Domain", if there is a notice about distibution restrictions of some kind, then the author may have misunderstood what "public domain" means and we'll try to contact them to straighten things out and make sure they don't have a problem with us including their stuff on the CDROM.

(Legally speaking, once something has been released into the public domain, the author has given up the rights to put any restrictions on it of any kind. Free Software and Public Domain Software aren't the same thing.)

* If something is marked as being shareware, you do not have to be the author to submit it, but you must include all of the appropriate files including the information on how to contact the copyright holder so that we can contact them to obtain permission if necessary.

* If something has a copyright notice, but is marked as being freely distributable, you do not have to be the author to submit it, but you must include all of the appropriate files.

* If something has a copyright notice, and is not marked as being shareware or as being freely distributable, before submitting it, please send email with whatever information is available for the program, but not the program itself.

==========

* Demo versions of commercially available software

We would like to include disabled demo versions of commercially available software. For example, if we weren't including a fully working version of Atari Works, we might instead include a demo version that would let you load and edit files, but not let you save or print (or would print with a special "DEMO VERSION" box on top of the regular text).

We would like to concentrate on developer-oriented & power-user software such as programming languages and utilities, program shells, disk utilities, and so forth. However, if space permits, we may be able to include a few more end-user oriented demos. If you would like to make such a submission, let us know and we'll try to get it on the disc if possible. A CDROM holds about 600mb and while that may sound like a lot (and is!) it can still get filled up very quickly.

It is strongly recommended that demo versions have their disabled sections completely removed, not simply disabled. If your demo version isn't supposed to be able to print, then take the printing

code out completely rather than simply jumping past it. If you don't take such steps, then somebody may figure out how to re-enable the disabled sections of the program.

==========

* Locked (password encrypted) versions of shareware and commercially available software

To go along with the demo versions mentioned above, it would be great if we could include actual working versions of some of these products. Let's use Hisoft's Lattice C as an example:

Suppose that there was a demo version on the disc that would let you create source code files up to 5K long and compile them. But you couldn't save the files, and you could only have 1 object module, and the resulting program would say "COMPILED WITH DEMO VERSION OF LATTICE C" several times whenever you ran it, and only work right if the Lattice C integrated environment had passed it a special code on the commandline when it ran.

Such a demo version would give the user a reasonable chance to see the program and decide if they like it or not, but without making the demo version useful in its own right.

So now a user sees the demo version and says "Wow, this looks pretty cool, and I'd like to buy the real thing." So they call up the publisher, which would be Oregon Research here in North America, or HISOFT in the U.K. and Europe, and they say "I have the Atari Developer CDROM and I want to purchase Lattice C".

At this point, the publisher would take down the user's credit card number, and say "What's the serial number for your CDROM?" and the user would tell them, and then they would be given a special password that can be used to install a fully working version of the program onto their hard disk from the CDROM. Some documentation would be included online, and the user would get a regular set of manuals in the mail a few days later.

This is good for the user: he gets to try out the software before he buys it.

This is good for the publisher: you save some money because you don't have to pay for fancy packaging, floppy disks, or even for manuals if you can manage to get it all in online form. You can sell the password at a discount compared with the regular price, and still make more per package than you normally do (since there is no distributor or dealer discount involved).

This is good for the user: he gets to save a little money
and gets to install the software from CDROM instead of having
to do it from floppy disks.

This is good for the publisher: You've got direct advertising
of the most effective kind aimed at the users who are going to
be most interested in this kind of product.

How does it work? Will it be secure?

Each CDROM will come with a floppy disk that is serialized.
Included on this disk will be an installation program shell
that will be used to install the locked software after a user
has purchased the password. This will be something that
Atari will put together that works as follows:

The user will run the shell, and their serial number will be
displayed on screen. They'll give this number to the
publisher, and the publisher will use a special program or
spreadsheet or otherwise figure out what the password needs
to be, and give the user this password.

Now the user can tell the installation shell what they want
to install. They'll point at the desired item and then the
shell will execute an installation program that the publisher
will create. The CDROM serial number will be given to this
installation program. Then the publisher's install program
will get the password from the user and combine it with the
CDROM serial number to generate a decryption code. Then the
install program will use this code to decode and install the
program.

There's more detail here than I'm giving, but I'd rather
discuss it only with those developers who are making a
submission. I think the basic idea that's important to get
across is that it will be at least as secure as your basic
floppy disk release. Plus, the resulting installed programs
can be marked in such a way that you'd be able to figure out
the serial number from the CDROM they were installed from.

Time permitting, there will probably be an Atari supplied
installation program that is capable of working in this
fashion, and it will be made available to those developers
who are interested.

==========

For the most part, we would like to avoid the use of file-compression
utilities such as ARC, LHARC, ZOO, or ZIP. We would prefer to have
files on the CDROM in an uncompressed format that is ready to use.
(The encrypted fully working versions of commercial software would be
an exception here.)

However, if we have so many submissions that we run out of room, some material may be placed onto the disc in an archived format. We plan to include the various file compression utilities on the disc, however, so the user will be able to decompress anything on the disc without needing to get anything like a decompression program from some other source.

==========

Please keep in mind that this is a developer-oriented CDROM, not aimed at the average end-user. There will probably be some sharp edges to watch out for, although we'll try to make everything as easy to figure out and use as possible.

If you want to submit an encrypted version of your software, please contact me AS SOON AS POSSIBLE so that we can get things worked out as early as possible.

In order to be included on the initial release of the disc, submissions must be received before the deadlines given below. Submissions made after the deadlines will be included if possible, but will most likely be held over for the next update of the disc.

The deadline for all submissions except encrypted versions of commercial programs is August 7. The deadline for encrypted versions of working programs is August 21. The CDROM will be going to production approximately the first week of September.

If there is some special reason you cannot make either deadline, please contact me as soon as possible so that we can make special arrangements if possible.

Your Submissions Are Welcome!

Please - DO NOT LIMIT THE CDROM TO DEVELOPERS ONLY - This is the stuff
that atari NEEDS to show the capability of the Atari range.

Sell it for $50 - $100 to as many people as possible, it is a very good reason
for buying a CDROM drive.

The more internal info that Atari gives the better. As many of the large
software houses have no interest in Atari it means that the small developer
(commercial and PD) will have to write it.

I would be interested for the Multitos - SpeedoGDOS - AtariWorks combo.

Throw in some PD Fonts as well.

Here in the UK this months PC MAGAZINE (Aug 93) just gave a CDROM disk FREE
with the magazine. This has over 170MB of software. Includes encrypted
versions of software that can be "unlocked" (for a fee) and installed on
a hard drive. There is plenty of PD PC software as well.

GO FOR IT Atari

regards dennis

3688. How to decompress master63.lzh?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-09 14:59:52 UTC
From: cordes@ac.dal.ca
Message-ID: <1993Jul9.115952.14886@ac.dal.ca>
Source record: 37641

I just got master63.lzh from paderborn, but I can't get it unarc'd. All my lha type programs fail because of a '.' in the path; i.e. I get an error message to the effect that the folder . can't be created (the archive tries to decompress to '.\master63\batch' etc). I've tried all kinds of combinations of commands but so far to no avail. Of course, I could extract without having the folder structure created but that would be a pain.

Can anyone tell me what switches I can set to handle this job? Thanks.

John

1): Dunno
2): Use 200 kOhm resistors on the left and right channels.

sF> Also can the headphone out drive a mixer line input?

Yup

sF>
sF> And finally (bonus question!), if the Falcon is aimed at the music indust
sF> didn't Atari provide line level analog i/o, like every other piece of MID
sF>

That irritates me as well !
I guess they reckoned that "normal" users would only plug a microphone
to the AD input, and "serious" users would buy a better AD system that
hooks onto the DSP port.

Switch the internal speaker off with xcontrol and the general.cpx.
This only disables the internal speaker, while the output is still
going to the headphone jack.

NVDI is a complete reimplementation of the VDI, including device drivers and
GDOS. It will speed up BIOS and GEMDOS screen output as well.
As for the name, I've seen less appropriately named products :-)

3701. Hard Disk Partitioning

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-10 20:56:00 UTC
From: wojci_g@pavo.concordia.ca
Message-ID: <10JUL199315561020@pavo.concordia.ca>
Source record: 37654

I would like to know if it's possible to subdivide a hard disk partition. Right now I have four partitions. C: 1,021,288 bytes, D: 9,908,205 bytes, E: 9,879,205 bytes, F: 21,910,362. C,D,E are GEM and F is BGM. Can I split my F partition into two 11 meg partitions?

Please, if you have any comments/advice, E-Mail me.

3702. MiNT questions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-11 06:56:41 UTC
From: lchd_ss@uhura.cc.rochester.edu
Message-ID: <1993Jul11.065641.29350@galileo.cc.rochester.edu>
Source record: 37656

I have some questions about MiNT and hope that someone
can answer me or direct me to the right source.

1. Is this the place to ask question about MiNT or is
the a mailing list for that?

2. I am running 0.95 on my MegaSTe4 with Multiuser setup.
How can I connect my 520ST(1Meg) to the MegaSTE and log in from
the 520ST. I am interested in this because the 520ST doesn't
have a hard drive and I would like to use the programs which
are on the MegaSTE.

3. Is it possible to let my MegaSTE communicate with a machine
running Unix? eg. file transfering, remote login from either
one of the machine to another etc.

3a. Is it possible through the telephone line?

4. What is Ka9q? I am reading the DOC files but since it's so long,
please tell me in a shorter way what is the most important uses
of it.

5. I used the Distibution disks from Atari.Archive to set up the
MiNT. Most of the stuff works fine but:
GCC runs but when I tried to compile a simple C program,
I see no output file at all. It didn't give any error message
either.

finger works for the 1st few days but now it tell me that
it couldn't open PTY.B

6. Is it safe to access GEM partitions under the Minix filesystem?

Thanks in advance

Hi,

yes, I think one comes with the C_TEX package available
on atari.archive.umich.edu
It's for an HP laserjet II I think, but their are upwardly
compatible so that should cause no problems.

When is WERCs likely to be upgraded to cope with them?
The standard DESKICN.RSC only shows one menu item.

3708. "The system is out of memory"

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-12 09:22:00 UTC
From: J.D.Coleman@newcastle.ac.uk
Message-ID: <CA1oop.JGw@newcastle.ac.uk>
Source record: 37661

I've extended my newdesk.inf with entries for more programs/icons (so I could make my desktop look more like Gemini :). When I tested it, I found a few problems :

a) The last entries in the file aren't used.
b) When I start a program, a dialog box with "The system is out of memory [OK]" appears. When I quit the program, all the open drive windows have gone.

On further testing, I discoverd that if the newdesk.inf is 123 lines or less, there are no problems, 125 lines and I can have 2 drive windows open with no problems and 127 lines and I can't have any windows open when I start a program.

Is this a known problem? Is there a patch?

BTW, hardware used :

STe (4Mb, 16MHz Adspeed)
TOS 2.06 UK
ICD Host adapter
Mono monitor

Thanks for any info,

J

3709. problems with a LPS240S and Mega STE

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-12 11:05:40 UTC
From: pswtrapp@ibm.rhrz.uni-bonn.de
Message-ID: <pswtrapp.1.742475140@ibm.rhrz.uni-bonn.de>
Source record: 37662

I have installed a Quantum LPS249S in my Meg STE on the orginal
SCSI-host. But now I've some problems with reading the Disk.
Sometime the Desktops is showing my confused or empty Directorys,
which is correct after a ESC-press. Also some programs (gcc,cheeta ..)
can't read all files (or dirs), so they showed me errors.
I have tryed the AHDI (vers 5) and the SCSI-Tools (2.07, Buffer:64,64,
400 !! Folders) driver, (with and without FOLDRXXX.PRG) without any
success.The Hd is partitioned in 7: C-I (16,50,40,40,30,30,rest or so), no
jumper is set. Maybe it's a Problem with the STE-cache, but i can't switch
it off without changing from 16 to 8 MHz (a error in the CPX ???),
but in the 8 MHz/cache off -mode it seems to work, but I want
my 16MHz !!!!! (proofed with SED440 and the Bugaboo's SYS)
Knows someone a program for the AUTO-Folder for changing to 16 MHz
or the right bit-combination for &FF8E21 (I think there are not only the
2 lowest bit like discribed in the PROFI-BUCH).
Thanxs Wolfgang

The problem is that the AES buffer can only cope with files up to 4096k.
If you find a patch, please let me know. The worst thing is that the
desktop gives you no warning when you save.

3714. CD-RO: profit for atari but only if the CD is cheep!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-12 15:18:13 UTC
From: ab@ersys.edmonton.ab.ca
Message-ID: <31yk7B2w165w@ersys.edmonton.ab.ca>
Source record: 37666

I hope that Atari makes the CD dirt cheep
i CD can be made for as little ase $5 if it is doen in mass
this means that a CD can sell for cheep (indeed to get permition
to place GNU stuff on the disk they MUST sell for cheep!) thus atari
can make easaly 10 to 15 bucks a disk erevy year that they come out
whith an upgrade. This is more $ then atari gets out of most of its
costomers, i bought the machein and that the last time i gave atari
a cent .... there CPU is great ...but ther periferals...

atari hase 2 chioces
1) sell the CD cheep and hope that all those crazy 14 year-old kidsuse
the info to make the atari sing 'n dance
2) hike the price sell none of them and let your competeters in bisness
and in the bootleg bissness drive you out of the market.
(at high prices the CD will be coppied and distrabuted illeagly so it
wont save atari - developers AND hackers are the only thing that will
save atari becouse noone beleaves arati can support the softwhere half of
the company. perhaps atari CAN run the softwhere aspect of the Co. but
every one i have talked to about bying an atari tells me that wont by one
becouse they BELIEVE that you can not provide devolopmint, this
perseption is the big hurdle you must overcome. an expensive devlopers
kit will not banish this perseption. high prices will however make
steeling the info on the CD atractive, thus you will sell none, lose
money, stop devloping the CD and devlopment will remaine ase sporatick
and slow ase at present. whith out an increase in softwhere devolopment
the atari will look less and less atractive and costomers will switch to
other platforms. compatition from bootlegger bisness will mean no
development and your bissness competters (IBM MAC AMEGA ect.) will eat
you.)

i am sorry for the bluntness of this measage but i feel that if atari is
to survive that sertan unpleasant thing should be said (and said bluntly
) to the excutive of atari.

-al
p.s. someone port gramatica to the AtariST ... quick!

3715. Obscure (or well known) VDI bug??

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-12 19:14:17 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <88382@ut-emx.uucp>
Source record: 37669

Hi, I have unearthed a mysterious problem while porting Atari Ghostscript 2.61, and the only source I can imagine is a buggy VDI routine. Has anyone ever seen the vr_trnsfm() routine break if the image is too large (in TOS 1.0)? Here is what happens:

Color images in GS are first put in the form of color planes, and then converted to the appropriate hardware-dependent format by vr_trnsfm() (or whatever the name of that routine is). This works fine up to a certain resolution (I think it was 106 ppi in st low res, and 111 ppi in st med res), and then suddenly goes haywire if you increase the resolution by 1 more pixel per inch.

"Haywire" means that the resulting image appears "wiggly" as if it were painted on the bottom of a slightly wavy pool (it is not moving however) instead of having smooth curves or straight lines. This change happens very suddenly as you increase the resolution, and then remains the same for higher resolutions.

I checked GS 2.52 and it indeed has a similar problem, except that instead of a wavy image, there is no image at all. This occurs at exactly the same resolutions as it does in GS 2.61, even though the routines used to render color images have changed completly between 2.52 and 2.61. This (and my experience with GS on other platforms) leads me to beleive that this is a problem specific to the atari. Since all the code I write is perfect and entirely bug free (:-), it must be Atari's fault. Seriously, I can't find any mistakes in my code, and it DOES work correctly for any resolution up to the given limits, so the only problem I can imagine is some bug in vr_trnsfm() which makes it choke on images that are too large. Has anyone ever had a problem like this?

I am using TOS 1.0 on a 4M 520, and I am nowhere close to running out of memory when this problem occurs. Any suggestions would be appreciated.

Thanks,

-Tim Gallivan

>Hi,
> I understand that startgem.prg expects only one line in
>statgem.inf. Is there any way of executing a sequence of GEM programs
>from the auto folder (perhaps not using startgem but something else)?
>
Surely you can use startgem to start a GEM program which then
reads a datafile which consists of lines of GEM prognames which are then
simply Pexec'ed in sequence until you come to the end of the file.

Such a program would be virtually trivial, you'd need something
like

```
FILE *fp; char filename[50];
/* Assume the list of GEM filenames are in file LISTFILE */
if (fp = fopen("LISTFILE\0","r"))
/* Next while statement gets executed if fp is not NULL */
while (filename = fgets(fp)) Pexec(0,filename,"\0","\0");
fclose(fp);
```

Though I've never tried it, surely the above must work? I guess
you'd better end its name with .PRG rather than .TOS though.

Cheers,
W. Alan B. Evans

GNU doesnt care if you charge a million dollars for their software as long as you include the source code and the rights for the user to modify and redistribute the code.

(But I too hope the CD is reasonably priced).

3723. Falcon audio double buffering

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-13 08:12:38 UTC
From: steve@wan.inf.rl.ac.uk
Message-ID: <13767@hardy.rl.ac.uk>
Source record: 37675

Does anyone know how to achieve reliable double buffering of audio "in the background"?
I want to record samples of length greater than my available memory so I want
to have two buffers; one which the system is DMAing to and one which I am processing.
When the system hits the end of frame I want to be able to switch buffers (I assume
I can process the other buffer in time). Now I see there is an xbios call to
set either the timerA or mono-detect interupts to be signalled at an end of frame
and there is another xbios call to set the start and end addresses of the audio in
frame. Questions:

(1) Can I reliably call xbios from an interupt routine?
(2) If I change frames from inside interrupt routine while recording, will I
drop samples at 50KHz?
(3) Is there any cleaner way to process a continuous stream from the ADC with
the main processor (how do direct-to-disk systems work) ?

Steven

I've had the same problem also, but with monochrome MFDBs. I was
trying to 'follow the rules', building a device-independant bitmap and
vr_trnfm() it for the screen. It failed on large (width > 1024 pixels
possibly) images. This is really wierd, considering that vr_trnfm()
should be a no-op in monochrome cases.

I haven't tried it since installing TOS 1.4 though (or using NVDI,
come to that...)

Is there a list of VDI bugs somewhere? F'r instance, anybody else
notice that wide lines get drawn 2 pixels too wide (except when
horizontal)? NVDI fixes *that* bug.

The internal drive starts with C: unless you work with a harddisk driver
that allows to change the logical order of physical drives. HuSHI, included
with the SCSITOOL by Hard & Soft, allows to reorder drives.

One important thing I forgot to mention in my previous answer about HuSHI:
The driver doesn't support Falcon SCSI yet.

There's indeed a bug in vr_trnfm(). You might try NVDI to make sure that this is really what happens. There's also a bug fix, but I'm not sure what the names is (and where to find it). Ask Laurenz Pruessner (spoil@cs.tu-berlin.de) for details.

Assuming that you are using C:

```
long L;
int Lo, Hi;

L = FunctionThatReturnsLong();

Hi = *((int*) &L);
Lo = *(((int*) &L) + 1);
```

Perform a test first, assigning something like 0x5555aaaa to L and verifying that Hi and Lo get the proper values. On Intel low-byte-first stuff, you swap the stuff assigned to Hi and Lo. I am pretty sure the 680x0 stuff stores the high word first in memory.

You could also do:

```
Hi = ((int*) &L)[0];
Lo = ((int*) &L)[1];
```

Depending upon which you think makes more sense.

Debugger for the Falcon
OK - silly question time. Does anybody know of a debugger that is really Falcon compatible? Preferrably, I need a name, address and a phone number for such a beast. It does not need to be a source code debugger but it does need to be able to understand the debugging symbols produced by Pure C.

MonTT does not work which was the most likely.

I think you mean hi and lo words.

```
long l;
hi = ((short) (l >> 16));
lo = ((short) l);
```

Assuming that short is 16 bits which is true for most (all?) compilers on the ST.

|>

Try this:

union {
unsigned long Lng ;
struct {
unsigned int Hi;
```

```
unsigned int Lo;
} parts ;
} value ;

value.Lng = FunctionThatReturnsLong();

then value.parts.Hi contains the upper word
and value.parts.Lo contains the lower word

A word of warning: This is only appicable to 680x0 processors. Other
processors sometimes have different byte/word ordering
than then 680x0 familly (read Intel 80x86).

While the wording seems to be excessive it does save some processing
time during execution.

3741. Hard drive on STe

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-13 19:53:49 UTC
From: i-bds@microsoft.com
Message-ID: <1993Jul13.195349.18974@microsoft.com>
Source record: 37592

Can anyone tell me what the conector on the back of my STe that says
"Hard Drive" really is? I can be so lucky as to have it be a SCSI port
so what does it take to connect a SCSI drive up?

Also I have a mono monitor hooked up and a tv for low res. Is there any way
to switch between the two without having to power off and unhook the mono
so I can get Color? Preferably some software, my preferences greys out the two
color options. I know it is possible, I have a couple of games that do it.

Thanks,
DFS

Here is an old article I wrote that should explain what you need to know/do.

~~~~~~

Hello,

This is what you're looking for. What you do is cut the
mono-detect wire on the ST monitor socket. This will require
removing the ST cover and top shielding. You don't have to
remove the the PC board.

Connect the PC board side of the cut wire to one side of a SPDT
switch, and the other side of the wire to the common terminal.
Use about six inches of wire, you'll want to route the switch
through a hole in the top shielding.

Once the soldering is done make a hole in the ST case just above
the modulator to fit the switch into. Route the switch through
the shielding, replace the shielding, fasten the switch into the
hole and replace the top cover of the ST.

```
*---< <------------< mono-detect
/ (cable side)
mono-detect >-------> >---* / *---< (open)
(PC side)
```

I have been using this in my vintage 520ST for over two years.
I'm not familiar with the STE, you may need to locate the switch
somewhere else. At any rate, I have had no problems and simply
throw the switch to change monitor/TV.

What's happening is that the mono_detect line is normally open for
color resolutions, but tied to ground for mono. The mono cable
simply shorts the mono_detect line to the ground line of the
monitor socket. Opening the switch prevents the mono cable from
having any effect.

Randy Hosler randyh@hpsadpk

Oh yea, I take no responsibility in the unlikely event that you
should inadvertantly kill your ST.

It's a propietary connector. You need a device called the Link from ICD to convert the ACSI (Atari Computer Systems Interface) signals to SCSI. You can connect any external SCSI drive (like those sold for Macs) to the Link. The Link also comes with (excellent) software to format and partition the software, among other things.

3745. CD-ROM help...weird bug

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-14 04:45:38 UTC
From: cse0507@desire.wright.edu
Message-ID: <1993Jul13.234538.11215@desire.wright.edu>
Source record: 37597

I have some odd behavior from CD-ROM drives. I cannot copy a file off it that is much more than 70-80k. If I do try to get anything with any length to it, it gets the first 100k or so, then the CD-ROM blinks a few more times and stops. The ICD software reports a bus reset (sense 29) about a minute later, and I can't access the CD-ROM until I reboot. Very very frustrating. The brand of mechanism doesn't seem to matter, nor the access time. I'm using ICD 6.0.7, the very latest (May 93) MetaDOS drivers from the net, and TOS 3.06 on an 18meg TT. I have played with the ICD settings for days, no result. The SCSI ID doesn't matter. The virtual drive letter doesn't matter. The discs are all ISO 9660, and are perfectly usable on my friend's Macintosh, *using the same drive*! The annoying part is I can get directories, Show Information on the drive, and get small files all day, until I try to access anything with any length. Any ideas?

Last year I wrote some tools to make remote login under MINT possible.
The package is called stlogin2.lzh and I think you can find it on many
ftp-sites.

It supports a getty that ask for username and password and then starts a shell.
Also small tools like talk and write to talk with other people on the host
ATARI and some stuff like last, who and so on.

Runs almost all ttp programs including editors, compilers and so on.

Obviously you haven't got the right libraries :( I don't use a 2.4.x
version of gcc, but I've listened to some discussion some days ago, where
it was mentioned that you'll need mintlibs32 or gnulibs8? (don't ask me
THAT number, please). Get the newest ones available, and it should work.

Version 1.9 of the ISO9660 driver (this should be the current version distributed by Atari) has a bug in Fseek() which breaks all programs that try to find out the file size by Fseeking to the end of the file. I hope that they'll release a fix ASAP.

>Runs almost all ttp programs including editors, compilers and so on.

Mine is much the same, in fact it's difficult to tell the system from a Unix machine. My package doesn't have a version of talk(1), but it does have write(1). I'm currently working on a new version which will have loads more stuff added.

There are some newer versions of M-disk (6.8 or higher ?),
maybe they will work with your setup.
(I think 6.8 comes with the Multi-TeX packet, but it is also
availible on several ftp-servers)

> Thanxs Wolfgang

Hello Wolfgang,

I don't think I can help with your hard disk problem. Last week I put a Maxtor 130 Meg in my MSTE, to replace the failed ST157N. The main problem I had was finding which jumpers to set, since Toad didn't send me the manufacturer's spec sheet. By experimenting I eventually found a combination which worked - one of the sets of jumper pins must have been to disable the SCSI parity checking (necessary for the Atari hd controller in the MSTE); I'm not sure what the other set of jumper pins is for, perhaps termination, or drive id?

I have heard that Cheetah can cause serious problems, so I don't use it.

As far as an auto folder program to set the MSTE to 16MHz, I _can_ help with that. I once wrote a small assembler program to toggle the appropriate bits (my assembler source was on the ST157N which is no longer working, but I could find out the details if you wish). The program is S16.PRG (it sets the MSTE to 16MHz, cache on). I now use S16_COFF.PRG, which sets 16MHz, cache on and also turns the keyboard click OFF. These programs can be run at any time, not necessarily from the AUTO folder, but if present in the AUTO folder (only use ONE of them) they will speed up the boot process. These programs don't put any message on the screen when they run, but you can check with XCONTROL that they do the job. The 2 progs are archived (-lh5-) and uuencoded in S16.UUE, which appears at the end of this message.

If I can be of more help, let me know.

Regards,
John

3755. HBS240 & Real-time clock

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-14 18:11:20 UTC
From: porret@elde1.epfl.ch
Message-ID: <1993Jul14.181120.1@elde1.epfl.ch>
Source record: 37609

I have a Mega ST computer and, one year ago, I bought a HBS240 board, including a 68000/16MHz processor and cache-RAM, to speed it up a bit.
Later, I noticed that my real time clock wasn't working anymore. I didn't understand why but it didn't bother me too much as I decided to buy a TT, what is done now.

As I wasn't using this HBS240, I sold it to a friend who also had a Mega ST. A month after he installed it, the same problem occured : he lost his real time clock (I mean, the chip is burned out and doesn't work at all).

I'm wondering if anybody had the same kind of experience and, if so, if you happen to know :

- Why and how does the HBS240 affect the hardware like that. As for me, I'm completely unable to understand where the incompability lies; I haven't a clue !

- How to avoid this problem.

If you use this board, please answer, even if you don't have any problem with it (I'd like to know if I'm just the unlucky one !).

Thank you.

INSOFT-L on LISTSERV@CIS.VUTBR.CZ Internationalization of Software
Discussion List

Internationalization of software relates to two subjects:

1. Software that is written so a user can easily change the
language of the interface;

2. Versions of software, such as Czech WordPerfect, whose
interface language differs from the original product.

Topics discussed on this list include:

-- Techniques for developing new software

-- Techniques for converting existing software

-- Internationalization tools

-- Announcements of internationalized public domain software

-- Announcements of foreign-language versions of commercial
software

-- Calls for papers

-- Conference announcements

-- References to documentation related to the
internationalization of software

This list is moderated.

Every time you do a Cconws("\7"), the system starts a new bell sound, even though the old one hadn't finished yet. So you hear one prolonged beep. Use a wait routine, eg. for (i=0; i<25; i++) Vsync(); inbetween the Cconws calls.

HiSoft are now advertising Falcon-compatible versions of Devpac and
Lattice C as `coming soon'.

I wonder if we can infer from your post that GST are working on Timeworks upgrades?! Something like TimeWorks publisher 3 would be nice, although I do realise that the port from Windows to ST GEM is harder than from DOS GEM to ST GEM.

3765. Accelerators

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-15 12:40:27 UTC
From: naffara@crc.ac.uk
Message-ID: <1993Jul15.124027.27144@crc.ac.uk>
Source record: 37619
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

How much difference will a software accelerator such as warp 9 or NVDI make on a Mega 4? Is either of these two better than the other?

Also would an accelerator board be any better considering the extra price? Can you combine the two?

Are there any problems with software compatibility?
(I have heard that Timeworks 2, which I use, does not work with NVDI)

Any idea of prices and places to buy/have fitted these in the UK?

Sorry about all the questions,
Phil
(E-mail pd@mbuc.bio.cam.ac.uk) Send replies to this address instead of the one at the top of the message

Oh yes, one more thing. Why is it a single A4 page (from Timeworks) takes about 20 minutes to print on a Canon BJ10e (in BJ mode, I haven't tried epson mode yet).
Will a accelerator help with this or is it just the combination of program+printer?

--

I went to hook a Syquest 44MB drive with an ICD AdSCSI+ controller to my Dad's 1040STf (circa 1987???). With the hard drive hooked up (which had worked on a 1040STe earlier), his computer wouldn't boot. Two questions:

1. Any idea why it won't boot? It won't read floppy drives if the controller is attached--keeps saying drive not ready--but disconnect the hard drive and everything works fine.

2. Thinking it might be the loose chip problem present in some early Ataris, I performed the old "drop one side on the desk" maneuver...unfortunately I didn't notice it til afterwards that the internal floppy drive was still running. Now it no longer works (and we have to run everything from an external drive). Did I trash the drive? Is it fixable? Any suggestions of where to get another floppy, or of a place that might be able to repair the current one?

Thanks for any suggestions!

I am in dire need of a tool to (hopefully) undelete a hard disk partition. I accidentally erased it, and am now in search of a good tool to try to reconstruct it.

The data is still present, and (perhaps luckily) the drive was recently defragmented.

Any help is greatly appreciated! I'm looking for any leads that can help bail me out on this one... undeleters, etc...

I think it does come with a cable; you wouldn't be able to use it otherwise.
But you can just buy one from ICD. They're about $20.

Well, I finally found out why MiNT 1.04 wouldn't work. It would display its message and hang there without loading the XFS files, even though if I removed the XFS files it would work, but would be very unstable. Weird huh? The problem was Warp9, so if anyone is having similar problems try killing W9. If someone has War9 and MiNT 1.04 working together, please let me know!!

3775. OverScan

Newsgroup: comp.sys.atari.st.tech

From: evanlang@sdf.lonestar.org
Message-ID: <CA8oot.1CJ@sdf.lonestar.org>
Source record: 37631
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've downloaded the 3 overscan docs and noticed that there are no instructions for a TOS 1.62 STE, and the MMU, GLU, and Video Shifter, the 3 chips that are used in th modification, are all different on the STE.

Has anyone done this modification to an STE machine? I have an NEC 3D Multisyc, and I would KILL for a little extra resolution (the monitor can certainly handle it!!). Also, the video shifter of the STE will sync to an external input, like the Falcon (kinda) and also has some other improvements. I would think such a modification would be easier. Anyone got it working (please no guessing, I'm willing to open the machine and play, but I'm no tech and would rather not let the magic smoke out of my computer. Nothing works after the magic smoke goes away!!)

Thanks a bunch.

.. please email me ..

Hatari!

a) The problem, that MultiTOS makes trouble, when you switch from TT-MED to ST-HIGH can only be a problem of an ACC or AUTO-PRG. On the TT of a friend of mine, there was no problem switching the screenmodes.

b) XCONTROL 1.31 is available. Look at several FTP-sides. (BTW: XCONTROL 1.2 seems to work better with MultitTOS!)

c) INTERFACE2 (Shift, Germany) can handle the new colored-icons, for the bw-deskicn-file you can take any iconeditor.

Greetings, Roland.

S>(3) Is there any cleaner way to process a continuous stream from the
S>ADC with the main processor (how do direct-to-disk systems work) ?
Use buffoper () to detect which buffer is actually written, you could work
(i.e. save to disk) on the other buffer. The buffer should be at least 2*64KB
(50Khz, 16Bit-Stereo), if you want write to disk.
A nonfragmented Disk will help.
The disadvantage is the busy-waiting using buffoper ().

Christoph.

[Specifics Deleted To Save Disc Space And Keep SysAdmin Happy]

Isn't that why GEM uses *.RSC files? All of the operator interface
is kept separately from the program so that all you need to do is
edit the *.RSC file and ship the edited file with the *same* program.
That reduces the issue to "where can I find someone who can trans-
late all these messages?"

Or am I _missing_ something, here?

From: round@sees.bangor.ac.uk
Message-ID: <1993Jul16.172926@sees.bangor.ac.uk>
Source record: 37548

Right here is one that might really be a bit of a challenge, what
I want to do is to connect a colour monitor (ex BBCmicro) to an
Atari ST. Now I don't have any information on the monitor other than
it works with a BBC micro and it is RGB. As I understand it the
monitor connection on the ST is RGB too.

What I would like is:

1 - The pinout for the ST monitor socket.

And if any of you are feeling really well informed

2 - The pinout for the monitor port on the BBC
3 - An informed guess of feasibility

If it is of any use the monitor was supplied by RS and is branded CUB.

Any information will be much appreciated.

3783. Maths Co-processors and Falcons?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-16 17:09:51 UTC
From: fraser@festival.ed.ac.uk
Message-ID: <38711@castle.ed.ac.uk>
Source record: 37630

Ok, everybody knows that the Falcon comes with a maths co-processor socket, but does anyone have any details about it.

Can a 68882 be used, or is it just a 68881 socket? (as the mega STE had, if I remember correctly). What speed processors can the socket handle? And most importantly, do you still need the special Atari chip in order to use one?

Also, does anyone know any distributers that sell these chips? I haven't seen them advertised anywhere, but I haven't tried phoning places yet.

What I really want is for my falcon to have a 50MHz 68882 working away in the background, either raytracing, or working on a rather intensive maths program I'm in the midst of writing, whilst MultiTOS runs everything perfectly in the foreground. (I can but dream...)

Thanks in advance,

John

>Floptical drives to an ST? Has anybody made a driver?

ICD claims that The Link, an ST->SCSI adaptor, can handle Flopticals when using
their software (comes with the adaptor).

Atari claims that the brandnew HDX/AHDI release (versions 5.04/6.06) handles
the Insite floptical correctly. Might be on TT and Falcon only, though.

I tried neither of these, so don't shoot the messenger...

bye, Peter

With the 68000 CPU (ST's and STE's, including MegaSTE's) the 68881 can't function as a true co-processor, so needs the Atari SFP004 interface to make it function as a peripheral. This isn't necessary with 68030 chips, so the 68881/68882 run as true co-processors, without the SFP004 board. I don't know for sure if the 68882 can be used, though my _guess_ would be that it can.

You can plug in a 68882 directly, no need for soldering or any additional boards. I don't know about speed, I have a 16MHz one installed. It is not I/O memory mapped, but a proper co-processor, speed on stuff like trigonometry is at least x10 faster than the 030. I got mine from the Atari Workshop 081-693 3355.

The 68881 and 68882 are pin-compatible - they are completely interchangable, from a hardware standpoint. There are some differences in software, but nothing major. In the Falcon, there is only a single clock input available, so it runs at the same 16 MHz as the CPU. I suppose if you wanted to, you could cut the clock lines and provide your own crystal to run at a different rate. There is no reason why the math processor must run at the same speed as the main processor, it's just the way Atari laid out their board. And no, you don't need any special adaptors to use the coprocessor, you just need to have the right chip layout (PGA, pin-grid-array).
>
>Also, does anyone know any distributers that sell these chips? I haven't
>seen them advertised anywhere, but I haven't tried phoning places yet.

Look in a Mac magazine, the ads in the back will list 'em. Probably other computer or electronics magazines will have 'em too. Lots of places that sell DRAMs will also have them available. Or you can probably get them directly from Motorola.
>
>What I really want is for my falcon to have a 50MHz 68882 working away
>in the background, either raytracing, or working on a rather intensive
>maths program I'm in the midst of writing, whilst MultiTOS runs everything

A Motorola math coprocessor is not a completely independent unit. In particular, it requires the main processor for all memory/operand accesses. Even in a compute-intensive application, 90% of your code will still be regular 68030 instructions, taking care of control flow, etc... Of course, if you *do* use a 68882 at 50 MHz, that last 10% of code will certainly execute very quickly...

From: evanlang@sdf.lonestar.org
Message-ID: <CAAoJn.6pq@sdf.lonestar.org>
Source record: 37546
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a few questions. I would like sone info on using the STE DMA sound. How do I access the micro-wire interface, and I remember something about the MFP seeing a change in the mono detect line at the end of a sample or something like that. I would also like some info on programming the MFP. Preferablly in C!

Why should we use shel_write()? Last I knew it killed the calling program. And that really sucks for 90% of the reasons why I'd ever call Pexec(). In fact there is no way to make shel_write load a program and load it concurrently either, like in MiNT. shel_write knows that some programs are text and some are GEM, will it use the TOSRUN pipe to execute programs?

I'm writing a transfer ACC and I'd like to it to multitask cooperatively on old systems, and pre-emptively with MiNT. I was planning on using Tfork() to do the actual transfer since that way it gets executed in the background pre-emptively under MiNT (and I can just sit in an evnt_multi call during the transfer), and will execute as a function call without MiNT. The problem with this is that I need to call evnt_multi() while the transfer is going if there is no MiNT. Can I latch onto some interrupt and make an evnt_multi() call from a timer interrupt? If so, how? I'd rather not just use evnt_multi after every block as that would slow down high speed transfers ALOT, and would eat CPU time for lunch at slow speeds. I would like to call evnt_multi() once per second. Also, how are semaphores used? MintLib, in its mentioning of Tfork() says that semaphores must be used for things like malloc(). Exactly what calls must be "semaphor"'d and how is this done?

Does MiNT 1.04 still use the blocking Pfork()? If so, should I assume that there is no magical fix in Mintlib 33 either and so fork() is still blocking?

Thanks a bunch for all your help, please send replies as E-Mail to :

I just ordered Diamond Edge, and spoke to the author about whether it could
do the job, and he assured me it would work. I'm looking forward to getting
it and seeing if it can recover the drive...

(I was sitting here thinking of writing my own utility to do it, but figured
I'd rather recover the drive than experiment. :))

It also doesn't hurt that the drive had just been defragmented.

:)

I have seen ICDBOOT 6.1.4 work on both a Falcon and a Link, and it
performed flawlessly. My guess is that you have a munged disk or
some corrupted files... My suggestion is that you talk to ICD.

3795. Problems with appl_find()...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-17 22:42:30 UTC
From: marco@sys6626.bison.mb.ca
Message-ID: <J6Pu7B2w165w@sys6626.bison.mb.ca>
Source record: 37547

I have written an ACC which checks to see if a certain application is installed every two minutes. The two minute delay is created using evnt_timer() and I check to see if the application is installed using appl_find().

Unfortunately, every once in a while this accessory "freezes" the computer at the exact moment I either start to load or start to exit another program. I think this lock up is a result of the appl_find() call, and not the evnt_timer() call.

Can anyone offer me any help? Am I doing something illegal?

Don't forget SCSI-Tool/HuSHI :-) (we were the first ones...)

It's really only a matter of handling removable media correctly (a),
to initiatilize the drive correctly (b) and to support media without
root sectors, especially Insite's VHD format (c). I don't know how
good AHDI and ICD are regarding (c).

Yes, I know what you mean. I have an ATARI SC1435 color monitor, and am not
getting anything out of it other than the stereo sound! I have a 14' monitor,
but the actual screen is the same size as the 12' monitor, and THAT has a
border! Well I also have an ATARI 1040 STE, TOS 1.62. I had heard that you
couldn't get overscan to work on an STE, but if you find out please let me
know.

Since the most frequent cause of massive data loss among people I've known is blown partition tables, I figure this fits in:

Any documentation available giving an overview of Atari partitioning? Given GEM, BGM and XGM partitions, not to mention installable file systems, I'm somewhat confused.

Is there a good way to back up partitioning information onto a floppy, such that if an operation blows the partitioning information, it can be restored?

And why do HDX 5.1 and 5.3 insist that the formatting information on my big (~600 MB) old (Wren V) SCSI drive is bad? It works fine, divided (a couple years ago, and with some difficulty) into partitions C: - I:. I'd like to do some fiddling with the booter, and this is a known way to lose partitioning. With HDX refusing to read or write it, I'm reduced to printing out physical sector 0--this gives me a bad feeling.

Steve

>>Anyone out there know where I can get the file detailling the
>installation >of a 1.44meg drive in a Mega-STE with AJAX chip?!

>Just
>plug it in and set the appropriate jumper (7?)

No! In a Mega STE, there might be more work to be done:

If the power supply is Rev. -001, remove the middle screw and insulate that point.

Check if you have a C309301-002 PAL in there; if it's -001, replace.

bye, Peter

3804. How to start *.prg from within a tos program?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-19 05:18:41 UTC
From: marc@targon.UUCP
Message-ID: <3408@targon.UUCP>
Source record: 37556

Hi,

As the subject says, I wonder if it is possible to start a gem program
(*.prg, *.app) from within a tos program (*.tos, *.ttp), and if so,
how it is done. Well, I know how to start it actually, but get
the infamous mouse hiding/showing mismatch behaviour.
I already tried to initialize gem within the tos program and tried
some v_hide_c and v_show_c combinations, but to no reveal.
Does anyone have a clue?
Oh, and by the way, is there any difference between a .prg and a .app?

Thanks,

Marc

Source record: 37446

Hi,

I have been having a very strange problem, and I was hoping someone
could help me out.

MasterBrowse generates a BUS ERROR (while loading) if it is run under
Gemini/Mupfel with no paramaters. To find out if the problem was with
MasterBrowse, I replaced the first line of code with code to bring
up an alert box. The alert never appeared, so the problem is
ocuring before my code starts.

Is there something going on between the two that I don't know about?
If I pass paramaters, everything works fine. No paramaters, and boom.
I am using HSC 1.40 (when is 2.0 going to be released, anyway?) and
the version of Gemini is 1.21UK (the english one).

Please respond by electronic mail, as it is much faster. If I find
out anything of interest, I'll summarize it to the network.

The AHDI 3.00 Release Notes contain all the information you need about GEM,
BGM, XGM.

>Is there a good way to back up partitioning information onto a floppy, such
>that if an operation blows the partitioning information, it can be restored?

In most cases a backup of the root sector is sufficient. A backup of all the
boot sectors is useful, too. Most disk monitors should be able to do that.

>And why do HDX 5.1 and 5.3 insist that the formatting information on my big
>(~600 MB) old (Wren V) SCSI drive is bad? It works fine, divided (a couple

In my opinion this is a bug in HDX. Even if all the information is
definitely correct HDX sometimes won`t partition a drive.

The bug has bitten...
You can try Knife to write a dummy boot sector then backup the drive and re-partition. Simply copy the boot sector of another partition. You will HAVE to reformat after that.

Message-ID: <NAW.93Jul19134752@draco.planet.bt.co.uk>
Source record: 37561

I'm presently using an STFM with Cubase. I've been toying with the idea of upgrading the system for sometime. Essential I'm tired of the games machine feel that Ataris give me and I want a proper machine.

However my choices are somewhat limited: I won't buy a DOS box on principle. (Even if only to run Linux, it's still keeping a dead architecture going.) I won't buy a Mac because of Apples position on look and feel copyrights. (And because for the hardware in them they're ridiculously overpriced slug boxes.) What I really want is a nice Un*x box like a Sparc Classic or IPX. However that would be a bigger outlay than I would really like to spend at present. So how frustrated will I feel with a Falcon + Mulitos + Mint.

How near to being a proper operation system is Multitos? (Don't say it is a proper operating system unless it's got virtual memory, process protection, IPC, and proper documentation.)

Also what about UK sources? Can anyone recomend a good cheap supplier? (With example prices.)
Ab.

I've been looking at the "changes" file and I noticed that those little error reports that mess up my desktop shouuld now be going into alert boxes. This would be ideal since printing them is usually worthless to me (my printer is running out of ribbon and paper and i really don't CARE about the basepage and such of a program that has stopped running).

It looks like some other program is needed to create and read the "alert pipe" and display the alerts. Is there a program around (a.a.u.e maybe?) that will accomplish this? If it isn't that big, can someone E-MAil it to me?

Also, the fsfirst/fsnext calls are supposed to return TOS compatible filenames now, even in a MiNT-domain process. Connect still shows the lower-cased names, and on a Minix partition (30 character names), I only get the first 8+3 characters of the filename, so if the filename is short, I don't see ANYTHING at all, at least that is what I THINK is happening, since folders show up fine but I can't find any filenames, I just have to type one in. This is in the file selector BTW.

Last, is multiTOS REALLY pre-emptive multitasking? Or is it cooperative multitasking AES running on top of a pre-emptive multitasking (MiNT) TOS? Will GENEVA pre-emptively multitask GEM programs with MiNT, or is it just cooperative even with miNT installed with respect to GEM programs?

Thanks .. please email replies if you can ..

Is there any word on a GEM Fast for GNUC? It would make life much better if my favorite GEM library would work with my current C compiler. I may have to find the source and see if I can port some of the higher level routines by hand. There are a few I'd like to use, even if they have to be cut from the rest of GEMFAST, even though a complete port would be best.

3816. System f***ed. What have I fried?

Hi People,

I was sitting at by machine (ST, w/106Mb HD - ICD etc.) when the ICD driver reported "Write failed" and "Sense $04". No need to panic, I thought, since I'd recently saved my work.

From the ICD book, sense $04 is "Drive not ready". Curious transient glitch, thought I. Let's reboot...

Upon reboot, my desktop shows just the two floppy drives! I try installing a "C" icon -- this drive "apparently does not exist". Hmmm... Upon inspection, even the floppies appear somewhat reticent: [Open...] spins the disk, but no window appears. (That screwed my normal "manual reboot of hard-disk" ploy.) [Show info..] gives me the "not responding, cancel, retry" guff.

There seems to be nothing I can do to get *any* disk, floppy or otherwise, to talk to me! I've re-seated all the chips on the motherboard, and ensured all the connectors are secured. All to no avail.

This is a bit of a bummer, to say the least. Can anyone suggest anything? I'm confident that my HD is still OK. I'd prefer to think a chip has died (although I'd want a good explanation for this!). Any clues would be *very* much appreciated.

Cheers,

Yes, you can use it ....
there are some little jumpers inside that you can change
to convert it to Analog RGB - this works well.

Switch off and leave for half an hour for the voltages to decay before
opening. Avoid the back of the tube!

From memory :
Inside you will see 4 small jumpers. 1 inverts the video, (leave it alone)
Of the other three (together) the left two move 1 space to the right,
the right one moves 1 space to the left.

If the colour is off, it has to be adjusted at the back of the tube -
Don't do this unless you know what you are doing :
THESE VOLTAGES ARE LETHAL!
use a long plastic adjuster - the adjusters are marked.
A1 VR932 adjusts the cut off - no drive = no raster.

3818. BFRDBU loaded to Atari Archive.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-19 18:21:19 UTC
From: wabe@ukc.ac.uk
Message-ID: <5283@eagle.ukc.ac.uk>
Source record: 37566
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have today (or WILL - if I can get access!!) downloaded my
Bootsector, Fats & Rootdirectory backup utility (BFRDBU10.ZOO) to a.a.

This is a program to safeguard against disaster should your Hard
Disk Fats and RootDirectory Info be corrupted - by imperfect hardware
and/or software - as has, alas, been reported quite often to this
Newsgroup in the past few months. It enables the Fats and RootDirectory
Info of specified Hard-Disk Partitions or other Volume(s) to be quickly
saved to .FBU files on floppy A:\. The info on these can be restored
should disaster occur. It takes but a minute or so to back up this Info
for ALL partitions on a 100 Mbyte Hard Disk - and so you can afford to
do this backup every time you boot-up by including BFRDBU.PRG as one of
your AUTO Folder Programs. Also it can safely be used with BGM
partitions. Only you can judge whether your Hard Disk is sufficiently
reliable for you NOT to take this precaution.

Further - suppose you typed "rm *" whilst in directory C:\ from
a shell by mistake - and the shell promptly goes about deleting very
many files before, in panic, you hit the Warm-Reset button - then, as I
found (once), the easiest way to redeem the situation is to restore the
FATS & Root Directory Info if you have a fairly recent copy. All files
that have not been disturbed since the backup was made become accessible
again thus avoiding utter disaster (note "UNDELETE" programs fail with
fragmented files).

Anyway, personally, I've found this useful over the past two or
three years and I think many out there might also. As it's easy, I
reproduce below an extract from the DOC file that accompanies BFRDBU.PRG
- so that you can judge whether it's what you've been waiting for or
not.

Cheers,
W. Alan B. Evans

********** Extract from BFRDBU.DOC **********

A few years ago, I had Hard Disk Troubles of the kind that led to
the FATS and ROOTDIRECTORY info on my SH205 being frequently
over-written. This of course results in making the files on that
partition, though largely undamaged, virtually inaccessible. In an
ideal world this should NEVER happen but imperfect hardware and/or
software can lead to this disastrous situation. Initially I wrote a
"full" Hard Disk backup program (HDQBUR - "Hard Disk Quick Backup &
Restore" which was distributed to the Archives in the past as part of
HD_UTILS). However, a "full" sector copy backup to floppies takes

rather a long time AND uses rather many floppies. I quickly realised that what I really needed was an utility that simply copied the FATS/ROOTDIRECTORY Info on a selected Partition to file (stored on floppy or, perhaps, on another Partition). This of course is quick and can be done every time you boot up. Then if a subsequent disaster occurs this info can be restored and thus access is regained to the locations of ALL rootdirectory files (and directories) that have not been altered since the last backup - provided, of course, they are undamaged by the initial disaster!!. However new files you may have created or files that have been edited since the last backup will of course be lost or "uncomplete". But often this is not so bad as they tend to be fresh in your mind and are usually fairly easily redeemable from some other source (e.g. floppy copy etc.). After "restoring" such Partitions it is advisable to check its FATS' integrity with some suitable Utility such as ICD's "CLEANUP" (which I personally find excellent) or, maybe, with Jorge Lohse's FSCK.PRG (though this is old and works only on non-extended {<= 16 Mbyte} and non-BGM partitions) and doubtless with other more recent disk-tools. Most imperfect files can be "weeded-out" this way.

Thus BFRDBU.PRG came to be born - and in the past couple of years has saved me a great deal of hassle, alas on several occasions. However I was under the impression that my "problem" Hard Disk was rather uncommon, but reading various ST-Newsgroups over the past few months alerted me to several others who have experienced similar difficulties. This prompted me to "tidy-up" the program a bit and offer it to the PD Archives - hence this submission. Basically BFRDBU is a simple program that makes minimal use of GEM - and is configured so that it can be optionally used as an AUTO-folder backup program at boot time.

BFRDBU will save the Bootsector-Fats-Rootdirectory Info on selected partitions (or Volumes) into .FBU (Fats Back-Up) files such as C_BFRD.FBU, .., E_BFRD.FBU that are saved on the Floppy Drive A:\. (an alternative scheme would be to save these in different partitions cyclically - e.g. if you have Partitions C:\, D:\ and E:\, then save C_BFRD.FBU to D:\, D_BFRD.FBU to E:\ and E_BFRD.FBU to C:\ - but the current BFRDBU.PRG does not offer this feature though it would make the back-ups even faster). Note the first letter of the Filename corresponds to that of the Volume whose info is saved in the file. BFRDBU also maintains one level of backup in .BAK files e.g. C_BFRD.BAK etc. The selection of drives to be backed is done simply by entering a string e.g. "CEF" (case or order does not matter) which is made up of the Drive Letters of all selected drives i.e. in this example you would be selecting Partitions C:\, E:\ anf F:\. The BACKUP option of BFRDBU does not use any GEM and so may be used at booting-up time. However, for the RESTORE option I thought it convenient to have some FormAlerts and the GEM FileSelector so that this (hopefully rarely needed) option must be done after boot-up within the GEM/AES environment. No elaborate explanations are needed - BFRDBU will prompt you with simple questions at each stage. Note it

does take into account logical sector size so that you can safely use it on BGM Partitions etc. (I have been doing so for years!).

I note, recently, that this simple (obvious?) idea has also been utilised in the recent (and, by all accounts, quite comprehensive) Disk Utility Program "Diamond Edge" of John Cordes et. al. (the UK importers are Hisoft). From what I read, I think "Diamond Edge" (in its "quick-backup" or whatever-they-call-it option) goes further than BFRDBU in that it will also store all subdirectory tree info also on the floppy. Of course, this is, in principle, better than the task that BFRDBU currently performs. However, it will take that much longer time and, of course, will still not be as good as a "full" backup. I will simply say that I, personally, have yet to know of an accident where both subdirectory AND rootdirectory contents were simultaneously damaged but with virtually all the files intact. Thus I never found it necessary to code this "subdirectory" feature in and I trust this will also be true for most potential users of BFRDBU. It does help a little if you ensure that the FIRST file on your disk (that follows immediately after the rootdirectory ends) is NOT a subdirecory sector but, preferably, some large, static and easily-replaced program e.g. CALAMUS.PRG or similar. If you _must_ have all Rootdirecory AND Subdirectory Info backed, then investigate "Diamond Edge".

Good Luck,
W. Alan B. Evans. July 1993.

Source record: 37572

I don't remember seeing this posted before but I read this in
August's issue of ST Format:

"Falcon bother
If you have a Falcon with an internal hard drive you should know that there is a small bug in
its operating system that can lead to loss of hard drive data.
If partition C is nearly full and a larger then the available space is copied to it, the data
overwrites the first cluster of partition D. This deletes the directory information of drive
D resulting in a wiped partition. Atari are aware of the problem and a fixed version of the
Falcon hard disk driver software should be ready now. Contact Atari on (UK) 0753 533344.

< other stuff about regularly backing up your HD deleted >"

So be warned and make sure you have the latest version of the HD software.

Hi,

Thanks to all those who answered my question about the bug in vr_trnfm(). Now for a nice question about icon handling.

I recently began playing around with icons, and I have encountered the following problem. There appears to be no way to tell when an the image of an icon has been corrupted by a window from another program.

I can draw an icon on the screen with objc_draw, select it, move it around, and even redraw it if a window from my own application destroys the icon image. BUT if the icon is covered by a window from another application (like the xcontrol window), there seems to be no way for my program to find out. What is generally done in such cases?

Thanks,

-Tim Gallivan

There is a problem with the Falcons Hard Disk software, on older
falcons at least. (mines nearly 3 months old) This allows data to overflow
from one full partition into the bootsector of the next making it completely
useless, though it can be fixed. This problem happened to me, and I
contacted Atari who have just sent me a new version of MultiTOS with
new HD software. This should prevent this overwriting from occuring,
although they didn't give any clues about how to rescue data from
affected partitions.

I understand from someone else that you do not need to reformat the disk
but just copy the boot sector of a same sized partition onto that partition.
Although I've not had a go at doing this yet... It probably needs
some disk utility.

Sorry thats not more help, but I've not sussed it myself yet!

Yeah, use the ICD utilities, they let you back up the two critical pieces
of data - the boot sector(s) and the partition sector(s), onto a floppy.
I believe they also store partition data in an undocumented place at
the end of some partition or something, so it can recover from some things
even if the partition sectors are wiped.

No one has done this to a STE, because there is no possibility to do so.
Overscan works by manipulating the Controlsignals from the Glue to the MMU and
the Shifter. In the STE the Glue and the MMU are packed into one single chip.
So it is not possible to break the line between the Glue and the MMU.

Source record: 37578

Hello,

I just recently got a 1040STf with a intermittant Internal Drive.
How can I get it to use my 2 external DS/DD drives that I used fine
with my 520ST????? I put the internal Floppy drive selector on 0,
and my 2 external dries on 1 and 2. (They range from 0-4, and also have
an extra pin for god knows what.) Mind you, my 520 knows how to use
them fine! I also tried totally disconnecting the internal drive
(power supply, and data cable), and putting my external drives on 0
and 1, but nothing happened! Can I completely bipass the internal
drive? Can you only have Floppy A, and Floppy B, with TOS 1.0????

Any comments would be greatly appreciated!

Chris.

There is a Dcntl opcode for u:\dev which lets you install a new device driver,
for documentation please look into biosfs.c, function name something with
dcntl. Once there was a device driver floating around named clockdev, which
was meant as a demo and documentation.

>

You cannot just draw onto the desktop - you must create your own
desktop (basically just a G_BOX with some sort of fill pattern, sized
to fit the screen) containing whatever icons (or whatever) you want to
display on it. Then use the wind_set(WF_NEWDESK, ...) call to register
your object tree with the AES.

I can't remember if the AES redraws it for you, or if you have to
catch redraws for window #0 (the desktop) yourself.

But having a new desktop is not very MultiTOS friendly, as all the
real desktop icons (etc) get obliterated.

3837. GEM is awful, is there a better GUI?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-20 15:06:47 UTC
From: sys1@exnet.co.uk
Message-ID: <CAGxzC.HI1@exnet.co.uk>
Source record: 37590

Greetings nice people.

I have decided (Ha! as if there was ever a choice) to buy a Falcon030 when I can get my hands on it. However, in the meantime a bit of research is called for. As I do not like the GEM GUI that is shipped with the Atari I was wondering if there was an alternative?

Any ideas?

Yours

Xavier G.

3838. Uncompress

Newsgroup: comp.sys.atari.st.tech

There are several Dcntl functions for adding device drivers. See the manual
page for Dcntl, and also the sample clock device driver (clockdev.c);
or, look at the MiNT source code (in biosfs.c, function bios_dcntl) for
details.

(Basically, you do something like
Dcntl(DEV_INSTALL, "U:\\DEV\\FOO", &d)
where "d" is a structure filled in with various information about your
device; this creates a device called "FOO").

3843. Cartridge port connector

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-20 21:20:18 UTC
From: jonesha1@ic.ac.uk
Message-ID: <1993Jul20.212018.10512@cc.ic.ac.uk>
Source record: 37589

I was sorting through some old Bytes though other day, and I found a neat
little project I would like to try, that attaches to the ST cartridge port.
According to the same article, the ST port doesn't use a standard pitch
for it's edge connector, 0.79 inch, they claim.

Does anyone know where I could get a prototyping board for this connector?
preferably a 'generic' one, with just perfboard, not a set of EPROM
sockets...
Even better, a UK source :)

thanks for any information,

howie

It's in ROM. I would suggest talking to CodeHead Technologies. I just received there price list and they are having a sale on right now on the Tos Extension Card which will upgrade you to TOS 2.06. It's going for $118.15 U.S. They can be reached at 213-386-5789 9AM-1PM PDT. I am considering upgrading my Mega 2.

Put this section in your code:

```
#ifdef HELLISH_KLUDGE
int __main( void )
{
return( 0 );
}
#endif
```

and use gcc -DHELLISH_KLUDGE until you find the latest libraries.

> Obviously you haven't got the right libraries :(I don't use a 2.4.x
> version of gcc, but I've listened to some discussion some days ago, where
> it was mentioned that you'll need mintlibs32 or gnulibs8? (don't ask me
> THAT number, please). Get the newest ones available, and it should work.

I'd REALLY be happy if someone were to create a canonical GCC/G++
set-of-archives (all in one directory) on atari.archive. In this
canonical directory, you'd have gcc.zoo (latest version of gcc), gxx.zoo
(latest version of g++), libg.zoo (latest libg.olb), libgxx.zoo (latest
libg++.olb), gemlib.zoo (latest libgem.olb), mintlib.zoo (latest
libmint.olb), etc. Each library archive should come with its latest
header files.

This would make it MUCH easier for a new user to get all the files they
need, and it'd make it easier to keep up to date with everything... just
watch the weekly newstuff postings from atari.archive.

Any volunteers? :-) I can't ftp, so I'm out... I also don't have the
latest MiNT libraries or GEM libraries...

3849. Composite Video

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-21 08:43:59 UTC
From: Patrice.Lacouture@aedi.insa-lyon.fr
Message-ID: <22ivkf$d29@cismsun.univ-lyon1.fr>
Source record: 37449

I'd like to produce black and white Video composite signal from the signals available on my ST (i.e R,G,B,H,V)

Let me tell you what I (think I) know about this and just tell me where I'm wrong:

A B&W Composite Video signal consists of :
- The light intensity signal
- The Vertical Sync and the Horizontal Sync just superposed to this signal.

There is no coding of any sort for B&W signal.
Only color video needs coding (NTSC,PAL,SECAM)

So, The way to obtain a composite video is simply to mix a luminance signal with two sync signals...

Questions :
- How to mix corrctly R, G, B signals to obtain an acceptable, well-balanced luminance signal ?
- How to add both sync to this signal to obtain a complete Comp.Video B&W signal ?

Thank you for all answers or piece of answers.
Schematics will be greatly apreciated !

Thank You...

Sure. The registers are:

```
-------+-----+-------------------------------------------+----------
###############IDE Controller (Falcon, ST-Book, IDE cards) ############
-------+-----+-------------------------------------------+----------
$F00000|long |Data Register |R/W
$F00005|byte |Error Register |R
$F00009|byte |Sector Count Register |W
$F0000D|byte |Sector Number Register |W
$F00011|byte |Cylinder Low Register |W
$F00015|byte |Cylinder High Register |W
$F00019|byte |Drive Head Register |W
$F0001D|byte |Status Register |R
$F0001D|byte |Command Register |W
$F00039|byte |Alternate Status Register |R
$F00039|byte |Data Output Register |W
```

IDE programming information is contained in the standards document
`AT Bus Attachment', which is available from ftp.uni-muenster.de,
pub/unix/docs (I guess), filename `atar4.*'.

This sounds great in theory, but the fact of the matter is that this
"canonical" area would never be canonical: it would by nature contain
more than some people need and not enough for others. It would also
probably get out of date very quickly.

What's really needed is an introductory file explaining what you need
to get started (there may already be one on the archive, I'll
check...)

I recently installed the latest versions of most of the GNU utilities
and libraries. The latest version of the GCC-TOS library was
installed and does not have the "missing ___main" problem with newer
GCC's.

While I'm talking about the new GCC, I should point out that the newer
GCC's are pretty UNstable. For example, I compiled MiNT 1.07 with GCC
2.4.1 and found that my printer no longer worked. Use with caution!

Cheers,

What would be even easier, is if the archivists at atari.archive who
are tracking what is the latest and what will work together, could set
up a set of symbolic links under those names, for the above stated reasons.

Cheers,

try

compress -d file.Z

with a shell you can alias "uncompress" to "compress -d".

3860. BMS scsi with 2 drives does not work. HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-22 05:21:47 UTC
From: korg@c3po.rdt.monash.edu.au
Message-ID: <korg.743318507@c3po.rdt.monash.edu.au>
Source record: 37463

Hi!

I have a BMS scsi controller working with a Seagate scsi drive (umm
ST571 or something a 40Meg job). A few days ago, I plugged in a
Dec Rz23l (a 120Meg drive) and I cant get it to be identified by the
bms controller.

(the controller is the smaller, more modern one 200 or 100? I forget now)-:

When I run the bmsinit program with my working 40Meg, I get
controller 0, drive 0 than then options.
When I run the bmsinit program with the Dec drive, I get
controller 0, NO drive and can go no further.
When I run the bmsinit program with the both drives, I get
controller 0 and controller 1. Controller 0 has drive 0 etc,
controller 1 has NO drive.

I have played with the drive numbers and I just cant get it to
appear anywhere, so I cant format or do anthing!

HELP!

And if you have an old TOS you must run compress.ttp througha CLI.
'command.prg' for example. Has something to do with TOS 1 converting
everything you type in a .ttp to upper case letters.

3866. Re: Sun 3/50 monitor on a TT ??

Newsgroup: comp.sys.atari.st.tech

Source record: 37469

I can't tell you about the video output to the TT monitor, or even the specs about the video levels used on this machine. BUT, I can tell you that the SUN monitor was driven by an ECL signal, and not pure video. Typical figures for this are;
Pixel Resolution:1152 x 900
Horiz freq : 61.8Khz
Vert Freq:66Hz
The sync signals are positive logic with sync on the rising edge. The ECL signal is intended for a differential ECL input terminated with an impedance of 100 ohms.
I don't really think it's of much for what you want to do.

You might be lucky then, since the TT output is also ECL level wit 100K impedance. However as stated in a previous article, the horizontal freq. fot the TT is 71 Hz. This may cause problems, but only for your monitor. If you connect it to the TT, it will only blow up your monitor if it can not cope with the higher frequency.

Just have a look at the technical specs. As far as I remember (it's a long time ago since I worked with SUN-2) this should be included with the SUN

>Any ideas?

You don't like GEM? Hmm, GEM is the graphics part of TOS. Nearly every
program on Atari uses GEM. Sorry, guy, the FALCON is not the right
computer for you.

If you mean the Desktop called 'Newdesk' (which has often nothing to do
with GEM :)) you'll see the Desktop of the FALCON with TOS 4.00-4.04 is
not that bad as you have seen it with TOS 1.x.

The standard alternatives are Gemini (probably best) and Neodesk3
(commercial). Gemini 1.21 does not work properly on my FALCON and I
don't expect Neodesk to work (dirty hacks).

Well, you can compile it! Get Heat n Serve C from the Languages
directory (I think) on atari.archive.umich.edu. It's easy to set up
and use if you have half a clue about using a compiler... And get
Gulam too 'cause it makes working with code easier. It's a CLI (like
csh) with a built-in emacs-like editor...

mode> It is a disk utility...

in this case, you probably can't use your code without some major
modification... If you really want to try, the Abacus book "ST Disk
Drives Inside and Out"" might help...

3871. Help? -Upgrading memory on old ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-22 13:51:41 UTC
From: cse0080@desire.wright.edu
Message-ID: <1993Jul22.085141.11486@desire.wright.edu>
Source record: 37471

I just picked up a 520ST, I believe the FM model, but am not sure. The RAM is on a little daughter-board that is plugged into one of the PLCC sockets, and has a ribbon cable running into the video area. My question is:

Is there any way to increase the amount of RAM on this machine? On my old ST, one of the originals, piggy-backed chips with fly-wires was used to increase memory from 512K to 1024K. Since the memory management chip supports up to 4Mbyte, I would like to increase the memory if at all possible. (Other than designing/building my own motherboard :) I believe the chips on the daughter-board are 256Kx4, and there are four of them.

Any information would be greatly appreciated.

Thanks,

Karl C. Hansen

Hello Netters,

I just bought Pure Pascal For the Atari ST because it presumably is pretty compatible to Borland Pascal 7.0, but after opening the box I came to the terrible finding that not even the Objects Unit is in the package.

In the past two days I have made a port of this (Without EMSStreams and MemoryStreams) and the thing seems to work, but I would like to know whether somebody has already made a good working port of this Unit (and maybe the rest of Turbo Vision) because testing my own port would probable cost me another two days and my holydays are over.

Thanks in advance,

Jan

3876. Happy Ending to Erased Partition!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-22 18:15:15 UTC
From: cmedley@wam.umd.edu
Message-ID: <22mlfj$abk@cville-srv.wam.umd.edu>
Source record: 37475
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Earlier this month, I posted asking for help in recovering my D:\
drive which I accidentally deleted with a boneheaded "rm *".

The rm program I used is one of the ones for the Minix filesystem that
also seems to work fine under TOS. I'm not sure what happened, but
the root directory of D:\ was not just deleted with the zero'd FAT
entries and the 0xe5 at the start of each file/folder name, but it
also had zero'd the root directory, and left the files in the subdirectories
completely untouched, since destroying the root unlinked all the rest.

This meant that getting Diamond Edge (Oregon Research) to undelete the
files wasn't possible. So I hunted down a sector editor and found
the excellent program MONOMON.LZH (available at atari.archive.umich.edu) and
I have to say this is the fastest and most comprehensive of the ones I've
tried for this job... it literally can read in and update the display as
quick as I wanted to go when manually hunting the disk for subdirectory
entries. It also had searching and editing capability that were perfect,
as well as the ability to exec another program (which i often did when
trying to fix things... i would exec Diamond Edge to see what the Disk Medic
said about my edited changes to the drive).

The gist of the story is that once I put in a fake deleted entry for the
subdirectory i wanted to recover, and fooled Diamond Edge, it recovered
everything else just as advertised. I'm now using Diamond Edge's "mirror"
option just to be safe. :) $50 well spent on Diamond Edge.

(if i can find out if the author of Monomon is still taking shareware fees,
i'm going to send him a nice shareware fee and a big thank you for his
program)

3877. Re: GCC 2.4.4

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-22 18:31:25 UTC

Message-ID: <1993Jul22.183125.17802@lmpsbbs.comm.mot.com>
Source record: 37478

The texinfo installation notes for GCC are very explicit about
minimum version requirements.

I don't particularly like reading through entire manual sets
before installing software but find that it is always worth reading
the installation notes before starting to install a new version of a
package because un-installing half a package is a nightmare and
dubious installations can lead to very difficult to spot problems
later on.

IMHO developers (esp. P.D. developers) should take note that
half a page of explanation on which directory to put files in;
what hard-coded paths exist; and what their set-up was
is extremely valuable for the effort.

>richards@foghorn.orl.mmc.com
>

Yes, err, no .. well. Look at function Kbdvbase() Xbios 34. It returns a pointer to a structure containing a number of vectors. One is the joystick vector. This is where the OS gets its info about the joystick. Of course, the joystick vector points to a routine that throws away the data.

You have to change the pointer into your own code. This only works for TOS programs though, which aren't supposed to do anything this nasty in the first place. If GEM is running while these vectors are moved, you die. I tried to provide a fall-through but wasn't successful.

MWC contains some info on the packets that are recieved through this vector as well as some code to display it while you move the mouse/joystick. After you move the vector to your own code, the function should recieve a pointer to 4 bytes.

If you want more info I might be able to find it (E-MAIL me). But, basically that is it. You might as well read from the hardware registers. I've never seen anything for the 15 pin ports.

3879. How to do a warn boot?

if you like simple x11 like shells containing windows you may try the MGR.
It has been ported from SUNOS to OS/9 on the ST, to MiNT and to Linux.
Unfortunately, there are very few applications (i'm just porting xdvi, but
that'll take a while). The programming model is nice, much simpler than GEM or
X11 and yet network transparent.

There are probably less than ten people using it regularly on the ST.

Not without some hardware mod. There is a module available that will make
this possible. In the UK you could try System Solutions 081-693 3355.

Source record: 37489

Hi,

A rather obvious question that still didn't come up but after two months:
what kind of UUCP mailer do you guys use to get on InterNet?
It's all about Atari in this windy corner, so either at least some of you
use an Atari UUCP mailer, or you just find Atari an aw'fly interesting
computer to write about and use your Macs and IBM's for mailing..

Third option is one I've been using up to now: crashing FidoNetmail onto a
Fido-UUCP gateway down the street. It works, but it's also a bit
embarrassing I don't know a thing about Unix.
So, please explain. How is it done?

thanks,

Paul

Well, i'd already committed to purchasing DiamondEdge... and as for the
Mirror program, that would do me no good since I had not mirrored the
drive before the deletion. So I had to rely on DiamondEdge and Monomon.

I didn't try checkdisk 3 mainly because i got progress out of the other
two so quickly....

>
>Bob

Hey!! Newell Industries is running a sale too. The TAB board (same function
as the TEC only TAB allows up to 1MB of ROM to be installed and works on just
about anything, some soldering is required) is going for $19.95, this is
without the TOS 2.06 ROMs though, and they must be bought from someplace else
for about $60. Still ALOT less than the TEC board.

3888. Second serial port required for a MegaST4.

Newsgroup: comp.sys.atari.st.tech

Hello,
Does anyone out there know if it is possible to make it so you can write data to the cartridge port? According to the schematics and manuals I have it is wired to the MMU so that any write attempts will result in a bus error. Is there any way short of mangling my computer to fix this?

Thanks,
Bill

I know it is possible to write to the cartridge port, as this is how Spectre GCR controlls the floppy disk, no mangling required. But I have no idea how this is done.

Well there are 2 resistors near the main filter caps, mains input side
of the P.S.U.

I don't remember the values but they could be 180-220k 1 or 1/2 watt type..

If one of these goes O/C the inverter will not start, replace
both with 3/4 watt metal film types...

3901. Falcon vro_cpyfm() trouble

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-24 13:19:00 UTC
From: m2ac@ohm.york.ac.uk
Message-ID: <1993Jul24.131900.24175@ohm.york.ac.uk>
Source record: 37508

Hi,...

I'm having a lot of trouble using the VDI call: vro_cpyfm(),
to save a portion of the screen to memory on a Falcon.
The program will crash if I try to save an area too near
to the top of the screen. Whats more, the actual distance from
the top that the problem occurs seems to be dependant on the amount
of screen area I want to save. Saving the bottom half of the screen
is fine.

It acts like it is trying to access a portion of memory that doesn't
exist, yet I'm sure that the screen coordinates passed are valid.

The problem is worst in 16 colours VGA, but will also occur in 256
VGA, (Also other modes, but I've not tried so exhaustively)

I'm using Prospero C which is about 3 years old on TOS 4.01.

If anyone has experienced similar problems or has found that their
TOS / complier combination works fine, I'd really like to know. In
particular I'm hoping to buy the Falcon version of Lattice C when
HiSoft finally finish the manuals, so if that, or previous versions
or any other compilers appear to work OK, or otherwise, please email me.

Thanks,
Andrew.

Is it an OS bug? <- Hope not!!
Is it a compiler bug? <- Hope so...
or
Is it me? <- Surely not...

Answers on a postcard please to...

A common trick to do this withouth modifying the computer, is to decode
only the higher bits of the adresses by the cartridge. The lower bits
then will be interpreted as written data, though the actual *access* by
the computer is a read access.
Some older projects by the german computer magazine c't used this
method. They even had a real time clock connected via a ROM socket. To
avoid interference with ordinary ROM accesses, one had to read three
times in sequence the highest adress of the ROM, then a circuit would
switch off the ROM and allow access to the clock chip. A similar
procedure would turn ROM on again.

> Does anyone out there know if it is possible to make it so you can write
> data to the cartridge port?

The cartridge port contains 16 bit address lines and 16 bit data lines with data strobe lines to switch between two 64k banks. The cart is designed to interpret an address to the upper bank as 16 bit data. Thus a dummy read to an address in the upper bank will actually use that 16 bit address as a data input. A read from an address in the lower bank will place data from the cart on the data lines as it was intended to do. In 1986 or 1987, there was an article in Byte magazine for a DIY clock cartridge. Go to your nearest library and see if you can find this article for more details.

3904. The system is out of memory II

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-24 17:07:49 UTC
From: J.D.Coleman@newcastle.ac.uk
Message-ID: <CAol92.3zs@newcastle.ac.uk>
Source record: 37509

Hi,

I little while ago, I asked why I kept getting a "The system is out of memory" alert box when I increased the size of my newdesk.inf file. Thanks to everyone who replied to my posting.

This is a known problem and occurs because there is a static amount of memory allocated by the AES for entries in the newdesk.inf file (about 4K).

There is a patch program called shbuf, which is able to increase the size of this buffer if used in conjunction with a program which relocates the ROMs into RAM.

I tried using gemram, but it came up with the error 'Can't identify GEM!'.
I tried using both TOS 2.06UK and TOS 1.06UK, but still no success (I've an Amitar TOS switcher installed in my STe - a great product).

If anyone has gemram (or similar) working with a UK TOS version, I would love to find out.

Thanks again,

J

> frustrated will I feel with a Falcon + Mulitos + Mint.

Well, other than the fact that the Falcon is barely powerful enough to
support its own graphics modes (the system crawls along at ST speed in
the 16-bit colour modes)... 16Mhz 68030, and a 14M RAM limit. IMHO,
the best amount of RAM for a new computer today is 8M, but the Falcon
only allows 1M, 4M and 14M.

> How near to being a proper operation system is Multitos? (Don't say it
> is a proper operating system unless it's got virtual memory, process
> protection, IPC, and proper documentation.)

No virtual memory.
Process protection.
IPC.
Bad end-user documentation (about 14 pages, or so I've heard!).

Hmm 50% of your wish list...

They don't work together; apparently Charles Johnson has said this is a bug
in Warp-9, which will be fixed.

NVDI and TurboST work find with MiNT 1.04.

Does anyone know if updated MiNT code will be released soon?

3910. Spectre 3.0 - Hard Disk

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-25 02:07:20 UTC
From: ak354@cleveland.Freenet.Edu
Message-ID: <22spso$e7i@usenet.INS.CWRU.Edu>
Source record: 37510

I am trying to format one of my hard disk partitions to support SPectre, but it doesn't seem to be working. The computer is a 2.5 Meg 520ST and the hard drive is a Quantum 240LPS using an ICD AdSCSI+ host adapter. I select the Format option from the Hard Disk menu on Specte 3.0. I have 9 partitions. The first is about 5 meg and the rest are a shade under 30 Meg. I select the 9th partition to be formatted. Spectre does it's thing, and lists this partition type as Spectre-P. (HFS) But when I quit back to the Spectre menu, the Partitions menu is still grayed out and neither Spectre nor the Mac seems to recognize this partition. If I re-run Spectre, it lists it as a GEM partition. It seems to work fine as a GEM partition from the desktop also. Can anyone explain why I can't format it for Spectre?

3911. Problem with wind_get.

I am writing a program which scrolls text in a window. The problem is that the wind_set routine doesn't return control to my program until the mouse button is released. I am using it to set the slider position. Is there any way around this? Right now, you must click once on the down arrow for each line scrolled. I want to have it continue to scroll until the mouse button is released. Any help would be greatly appreciated.

Yes, they will work, without problems. I've had a Quantum 105S and an
LPS105S connected to the ICD SCSI adapter.

>only rings once. Is that normal?

Yes, since the sound processing is done concurrently to your multiple call.
Your second ring will be processed very shortly after the first one,
overlapping the latter. All you'll get is a single ring.

This is a bug in one of the string handling routines in H&S C; we found
it in the 1.40i beta test... Something tells me Ian needs better
revision control software, since somebody fixed that about a year ago.

3922. Music File Format/MOD & Tracker Programmer Mailing List Announcement

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-25 20:17:47 UTC
From: jamal@bronze.lcs.mit.edu
Message-ID: <22uppb$7f2@bronze.lcs.mit.edu>
Source record: 37518
Cross-posted to: rec.games.programmer,comp.music,comp.os.msdos.programmer,comp.sys.apple2,comp.sys.next.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.mac.programmer

Depending on the response I get, I will be starting a mailing list for the discussion of computer music application programming, with the MOD format as a major topic. The list will be for people from all of the major computers (Amiga, Mac, Atari ST, IBM AT, NeXT) because by now they all have mod players and soon will all have editors, increasing the amount of (hopefully) decent computer music available out there for everyone.

The problem is, there is alot of confusion about the "mod" format, and related mod-type formats (like MED, Okata, etc), and alot of the understanding of how to play these files comes from examining source code other people have written! What we need is a forum for people to talk specificaly about the music formats out there and exchange as much information as possible about them, in order to help everyone write better music editor and player programs!

If you are a programmer and want to write a mod editor (tracker) or mod player, even a general (MIDI or non-MIDI) music editor, or you have written one in the past, please send me email telling me you would be interested in being on this electronic mailing list... or if you know anyone else who has written a soundtrack program, or developed one of the music file formats, please forward this message to them!

I'm also looking for the original programmers of applications like "SoundTracker", "NoiseTracker", and the like.. some of these people are known only by BBS "handles", and may only have accounts on remote BBS systems. If you know any of their email addresses, please tell me.
(The people who originaly created the music file formats of course have the most information on them.)

>>> If you are interested in this mailing list, please send me email <<<

Yes, don't use wind_set :-) Actually, i wasn't aware that it would not
return with the mouse button down. Are you sure it isn't some AUTO program
your running ?

>arrow for each line scrolled. I want to have it continue to scroll until
>the mouse button is released. Any help would be greatly appreciated.

Your routine should detect simply it in evnt_multi. When you get the arrow
message, use vro_cpyfm() to scroll the text. Set the slider ONLY after the
user has released the button (when you get the messages, check the mouse button
state, while its down, update the display (turn on wind_update ONCE and do not
release it until the user releases the mouse button for speed) as fast as
possible and don't worry about sliders or evnt_multi calls until the mouse
button comes up).

I'm the one who compiled this assembler for the Atari ST.
I don't know if the Falcon directory is the most suitable place for this
assembler, because the package has no Falcon specific tools. And I don't know
how to download the generated code to the DSP in the Falcon. That's why I
didn't mention the name Falcon in the readme file. And that's why I put it in
the language subdirectory on our Atari archive and not in a Falcon directory.
But I'd like to know if someone uses this assembler on his Falcon, so I can
make the a note about it in the readme file.

BTW: Someone messed up when he unpacked my a56.zoo file and created the
asm56.zoo file. He ignored the directory structure and overwrote the original
readme file. You can find the complete package at our archive:

I have seen a number of postings asking for details about using the joysticks on the ST. This posting attempts to provide some help.

I never saw it properly documented, so about 4 years ago, using information from the old Abacus/DataBecker internals book, I set about investigating the Keyboard vector routines, using a packet handler which I could patch into the vectors I wanted to investigate. The C program I used is given below. As written, it hooks into the status and joystick vectors. For just the joystick information, it is not necessary to use the status vector. Obviously, the program could be cut dow to just bare bones for joystick handling, but I thought the complete thing might be of interest.

It was compiled using Lattice C 3.0.4. UBYTE is just a typedef of unsigned char. You won't need <portab.h> if you define this by hand. cprintf() is just printf() directly to the console. The include file <fctype.h> is just a variant of <ctype.h>, which itself would do fine.

It should be compiled to a .TOS executable.

```
------------------------------------------------------------------------
#include <portab.h>
#include <osbind.h>
#include <fctype.h>

typedef struct {
void (*midivec)();
void (*vkbderr)();
void (*vmiderr)();
void (*statvec)();
void (*mousevec)();
void (*clockvec)();
void (*joyvec)();
void (*midisys)();
void (*ikbdsys)();
```

```
} KBVEC;

UBYTE joy0,joy1;
UBYTE list[10];
int got=FALSE;

void dopkt(packet)
UBYTE packet[];
{
register int i;

for(i=0;i<10;i++)
list[i]=packet[i];
got=TRUE;

if (packet[0]>=0xFE) {
joy0=packet[1];
joy1=packet[2];
}
}

void main()
{
KBVEC *p,save;
UBYTE old0,old1;
char buf[128];
int cmd;
char c;

p = (KBVEC *)Kbdvbase();
save.joyvec = p->joyvec;
p->joyvec = dopkt;
save.statvec = p->statvec;
p->statvec = dopkt;

Ikbdws(0,"\x12"); /* Turn mouse off */

old0=old1=0xFF;
cmd = 0;

for(;;) {

cprintf("Packet = %02X %02X %02X %02X %02X %02X %02X %02X %02X %02X\r\n",
list[0],list[1],list[2],list[3],list[4],
list[5],list[6],list[7],list[8],list[9]);
got=FALSE;
}

if (old0 != joy0) {
old0 = joy0;
cprintf("Joy0 = %02X\r\n",old0);
}

if (old1 != joy1) {
old1 = joy1;
cprintf("Joy1 = %02X\r\n",old1);
}
}
}
```

Armed with the information gleaned by this program, it was possible to write assembler routines to setup, use and unsetup the joystick. JOYINI and JOYEND should be callable from ASM or C, and the global variables JOY0 and JOY1 will be updated automatically whenever a joystick state changes.

I can't remember what bit means what, but that is easily determined by trial and error.

```
;
JOYINI MOVEM.L A0-A1/D0,-(SP) ; Save registers
MOVE.W #34,-(SP) ; Kbdvbase()
TRAP #14 ; Xbios
LEA 2(SP),SP ; Better than ADDQ, as it
; doesn't set any flags.
; Now D0 points to the table of longword vectors. The
; joystick vector is at offset 24 from this.
;
MOVEA.L D0,A0 ; Must be in an addr reg
```

```
MOVE.L A0,ADRSAV ; Save table address
MOVE.L 24(A0),JOYSAV ; Save current joy value
LEA OURJOY(PC),A1 ; Position independent
MOVE.L A1,24(A0) ; Point vector to our code
PEA MOUSOF(PC) ; Command to turn off mouse
MOVE.W #MOUSOFL-1,-(SP) ; Length-1
MOVE.W #25,-(SP) ; Ikbdws()
TRAP #14 ; Xbios
LEA 8(SP),SP ; Tidy stack
MOVEM.L (SP)+,A0-A1/D0 ; Restore registers
RTS
;
JOYEND MOVEM.L A0,-(SP) ; Save registers
MOVEA.L ADRSAV,A0 ; Point to table
MOVE.L JOYSAV,24(A0) ; Restore old value
PEA MOUSON(PC) ; Command to restore mouse
MOVE.W #MOUSONL-1,-(SP) ; Length-1
MOVE.W #25,-(SP) ; Ikbdws()
TRAP #14 ; Xbios
LEA 8(SP),SP ; Tidy stack
MOVEM.L (SP)+,A0 ; Restore registers
RTS
;
MOUSOF DC.B $12
MOUSOFL EQU *-MOUSOF
MOUSON DC.B $08
MOUSONL EQU *-MOUSON
;
; This next is our joystick interrupt routine. We may use
; registers A0-A2 and D0-D2 without having to save them.
;
OURJOY MOVEA.L 4(SP),A0 ; Pointer to packet
CMPI.B #$FE,(A0) ; Joystick packet?
BLO.S NOJOY ; Ignore if not
YESJOY MOVE.B 1(A0),JOY0 ; Copy joystick 0.
MOVE.B 2(A0),JOY1 ; Copy joystick 1.

: data to the cartridge port? According to the schematics and manuals I have
: it is wired to the MMU so that any write attempts will result in a bus
: error. Is there any way short of mangling my computer to fix this?

You can use the ADDRESS lines for writing data, i e you address a certain
location in the address space of the cartridge port and use [part of]
that address as the data to be written.

Of course, the device connected to the port must understand the protocol
you are using.

>> frustrated will I feel with a Falcon + Mulitos + Mint.
>

I have an STFM (expanded to 4M) with 30M HD and have also felt that it has a games machine 'feel'. It was also pretty slow, so I decided it was time for an upgrade. I considered several options but ended up with 2 in the end.

1) The Falcon (4M, 65M HD)
2) The Archimedes A5000 (4M, 80M HD)

I was unsure about the Falcon, although was put off when I heard it was still GEM-based, and basically looked like a very fast ST. Since I am more of a developer rather than a user, it lost its appeal. This is why I went for the Archimedes A5000 in the end.

OK, maybe the no. of colours aren't as good (256 max, unless you write some smart code to catch the horiz. syncs), and the software support isn't as good (not that there is a lot available yet for the Falcon. But when it comes to development, it's great !

Get a demonstration of an A5000 and see what you think before deciding what to go for. It's a bit more expensive than the Falcon :

A5000 - 4M RAM, 80M HD, 25 Mhz ARM 3 processor - approx. 1700 GB pounds (inc. VAT). including Acorn Multiscan monitor (worth 200-300)

There are plenty of PD progs available... and if the A5000 is too dear, there are some lower end models, also with the ARM 3 (which provides around 13 MIPS on the A5000 - or even faster with the 33 Mhz ARM 3).

Although this is probably not a good indication of performance, since it will depend on the Compiler, I ran sieve.c (Sieve of Eratosthenes (or however you spell it)) on both my A5000 and my SUN IPX (at work) for 1000 iterations.

IPX : 24 seconds
A5000 : 18 seconds

As you can see, there is no lack of speed from the Archie. (OK, so the IPX can handle more users...but I'm the only one on my Archie).

Just thought I'd give you my thoughts on the subject...

>Well, other than the fact that the Falcon is barely powerful enough to
>support its own graphics modes (the system crawls along at ST speed in
>the 16-bit colour modes)... 16Mhz 68030, and a 14M RAM limit. IMHO,
>the best amount of RAM for a new computer today is 8M, but the Falcon
>only allows 1M, 4M and 14M.
>

I'm not sure what the limit is with the Archimedes regarding RAM. Concerning graphics, there is no real noticeable difference between the lowest res, fewest colour modes and the highest res, greatest colour modes (again, see comments about the no. of colours).

>> How near to being a proper operation system is Multitos? (Don't say it
>> is a proper operating system unless it's got virtual memory, process
>> protection, IPC, and proper documentation.)
>
>No virtual memory.
>Process protection.
>IPC.
>Bad end-user documentation (about 14 pages, or so I've heard!).
>

Don't know how the Archimedes fares here. I know of a PD virtual memory system which, according to a friend, works very well. I think it allows up to 24 M of virtual memory.

Process protection and IPC I'm not sure about, although I dare say it is supported.

End-user documentation isn't the greatest unless you get the PRM (Programmers Reference Manual). This is pretty essential if you're going to do any programming, and is a bit pricey, although well worth it (100 pounds + VAT). This is actually a set of 4 thick manuals, and a separate index manual.

OK, so it sounds like I'm advertising, but I'm really pleased with what I got. I'm not, by any means, saying that the Falcon is not a good machine, just that the Archimedes suits my needs better.

ps. I'll still be keeping my ST...

Ummm.... It was the island of Niihama, not Niihau. That's what I get for not having the article in front of me while posting. Thanks to the many senders of private email, most of whom wanted to know how one of the Hawaiian islands (Niihau) got over to Japan. In defense, I can only claim that it's summer time and I'm in San Diego, therefore distracted by outdoors goings-on....

> --

There is another way for the NOT-FAINT-OF-HEART that involves a hardware modification. I have done it and build my own cartridge breakout board for use with computer-driven projects.

The 68000 has an asynchronous bus protocol. When an address is output during either a read or a write, the device accessed is supposed to assert *ACK* (An active-low input to the 68000. The name might be *DACK*, I don't have my book here ...:) Since the MMU handles all accesses to the devices in the ST, it asserts the ack signal for the devices it has been designed to handle, which includes READ accesses of the cartridge address space. Another part of the MMU asserts (pulls low) the *BERR* buss error pin after a pre-determined number of cycles have passed with no assertion of *ACK*. I checked this with a scope, on my first ST, so unless they have changed the internals of the MMU ....

Now, in the best of worlds, both the *BERR* and *ACK* are passively pulled high by a resistor. In this case, merely connecting a circuit which decodes WRITE accesses to the cartridge address space and uses an OPEN-DRAIN CMOS-compatible gate to assert *ACK* for those accesses will avert the buss error problems. You still need to bring the R/W line out to the connector somehow.

I took a safer aproach and broke the trace between the MMU and the CPU on the *ACK* line. I then bridged the cut with a 100 ohm resistor. On the CPU side of the bridge, I connected the OPEN-DRAIN circuit I had designed. I used a 22-guage (sp?) twisted pair to bring the R/W line over to the connector. I seem to recall that I used a no-connect pin to pass it through the connector, but I may have sacrificed one of the ground pins to do it. It has been a long time since I did it. I used the resistor because I was afraid the MMU might have an active output for the *ACK* line rather than an OPEN-DRAIN output.

The mod worked like a champ. I later modified the mod to enable me to connect peripherals to the breakout board which took care of asserting *ACK*, but that required also bringing out the *ACK* signal. There was a little more involved but right now it escapes me.

==========quote below==========
They don't work together; apparently Charles Johnson has said this is a bug
in Warp-9, which will be fixed.

NVDI and TurboST work find with MiNT 1.04.

Does anyone know if updated MiNT code will be released soon?
==========

Not only do they not work together, but I called Codehead to see if there
was or would be an update to Warp9 to make it work with MiNT/MultiTOS. You
know what I was told? I was told I shouldn't hold my breath!! No upgrade
at all is planned. Codehead blamed ATARI saying that resident programs just
don't work right with MultiTOS because it really "isn't ready" even though its
been released. I then said, "I hear there is a program called NVDI that works
fine." He says, "I heard that too".

Now, tell me, if its all Atari's fault because MiNT/MultiTOS are so horrible,
then why would NVDI work when Warp9 won't ?? And I also think its pretty rude
to tell someone with a problem that they shouldn't hold there breath!! What
choice did I have? Run without MiNt, No way! Run without Warp9, slow, Not
if I can help it. Run without Warp9, and buy NVDI! Hey, I ordered NVDI !

If Charles Johnson has promised an upgrade, then he needs to kill the guy that
I always get on the phone at Codehead tech support. That guy has lost me as
a customer. Codehead will have to REALLY offer some extraordinary stuff for
me to ever buy something from them again. Whenever I get a problem, its always
"MY" problem for me to handle. How nice.

3934. FALCON SALES

No. Disk formats are similar enough on the ST and PC (read identical
except for a few bytes) that compiling it on the ST should be fairly
straightforward.

Well, I don't take Atari's blatant optimism without a grain of salt, and i
guess I have to be fair and say that given Mariano's past history with
Atari, and his excellent (gag!) reporting, I won't take this one seriously
until he (or someone else):

1) gives this "super sleuth"'s name
2) can back up the statements

This is tabloid journalism.

(I remember back when I had to hunt down Ron Kovacs who did ZNET for the ST
to tell him he had omitted me from a listing of vendors at the Pittsburgh
Atari show back in '91... i had two tables.. more than any non-dealer vendor!
He told me... "Well, i guess you just weren't important!" and never mentioned
ENiGMA Software... i love the attitude of these online journalists... and they
wonder why some of us don't write commercial stuff?)

It will come to that... Apple's new DSP macs will be out on Monday August 2 at
MacWorld Boston. The prices are lower than expected.

The Centris 660 AV with a dual dsp for sound and video, built in GEO ports, the
casper voice recognition will cost $2139(8/80 config) list. This model will be
powered up with a 25 mhz. 680400. Atari does not have a chance. I suspect
Apple will ship out in the week of its releace(next week) volume that will
surpass the install base of Falcons. Nice try Atari. But you deserve to go
out of business.

Problem with Apples new computers is that it's a dead end system. Apple will
will be phasing the Mac out as soon as the powerPC hits sometime next year.

Now with the Atari the falcon will be the computer that Atari is still shipping
5 years from now. Think of the savings in money and software. Fact of the
matter is I'm still using the same ST computer I bought 5-6 years ago. It
also still does what I need.

The six sockets are for ROM (and only 2 are filled because you have a 2chip version of the TOS (probably 1.02)).
The RAM is made of DRAM (dynamic RAM) which is made of rather small chips (around 20 pins). There should be either 4,8,16 or 32 (depending on your memory configuration and the chips used) totally similar chips with numbers like: 41256 or 414256 or 411000 or...
There won't be any sockets for the new memory (as far as I know), so that soldering will be necessary (as well as some doc on the pinout of several chips (MMU, DRAM, maybe 74LS373 or others) and also adding one or two resistors)

>Any help would be great!

Help:
- any DRAM should work, but the obvious choice is to get 1MB SIMMS
- if you know what you're doing, it's not too hard. But it may be not trivial if you don't have the docs and tools at hand.

>Chris.

Stefan

PS: I still have that strange feeling that my help wasn't great.

3941. ST4766N and AdSCSI Plus ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-27 12:17:07 UTC
From: DBRIGHAM@nsf.gov
Message-ID: <DBRIGHAM.15.743775427@nsf.gov>
Source record: 37399

I just 'scraped' up a Seagate ST4766N SCSI hard drive, I think it is about 650MB formatted. Should it work alright with an AdSCSI Plus on an STe? Does someone know the paramters I will probably need to enter when formatting/partitioning it (hds, cyls, etc.)?

Also, I will probably use it on both my 1040STe (4MB RAM) and my old 1040STf, which have TOS 1.6 and 1.0 respectively. That means I should be using no larger than a 16MB boot partition, and the STf will only 'see' the partitions 16MB or smaller, right?

Oh, where can I grab the latest ICD utils - assuming I need them for the AdSCSI Plus and this hard drive....?

Thanx....

So fine and dandy for Apple. According to a recent article in the
business section of our local paper, Apple is not doing that much
better than Atari. Look at the number of computers they have for
sale. Think about the development costs to design those machines.
Think about how they have to price them at very low profit margins to
compete against PC clones. Sure Apple may be the biggest single
manufacturer of PCs. But according to this article, Apples hopes are
all based on their ability to put out a PowerPC based machine within a
year. It looks bad for ALL Motorola based PC manufacturers these
days.

If it is a 650mbyte hd then you'd end up with 40 16 meg partitions, which the systems will not support. Change your TOS 1.0 to 1.4 ($50 US) and use large partitions, so both systems can use the drive. TOS 1.4 is a major improvement over 1.0, IMHO of course. If you bought your AdSCSI Plus a long time ago, for your ST it may not work correctly with the STe, contact ICD if you have any questions ((815) 968-2228 ask for Howard).

The latest ICD software is available on GEnie. If you do not have a GEnie account ask Howard for the ICD BBS phone number.

>on a ftp site?

The software is included with the Gemulator hardware, which sells for about $200. However, having the software by itself is useless since it does nothing without the hardware.

3945. Please help with assembler code (Steve Eker?).

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-27 18:23:40 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <88631@ut-emx.uucp>
Source record: 37396
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

Steve Eker sent me an assembler image transformation routine to use in Ghostscript. It works fine (with minor modification) for 2 and 4 bit color, but it clearly cannot work for 8 or more colors. I cannot reach Mr. Eker via email, so I am asking the net for suggestions on how to modify the code to handle more color planes (I am not much of an assembly programmer). The (4-bit) code is included below.

This routine is used to convert an image from Ghostscript's format to the standard GEM color-plane format. The Ghostscript format has all of the bits representing a pixel stored together in memory. For 4-bit color, this means that the first byte of the image contains the first 2 pixels.

The problem with the routine below is that it uses address registers to store pointers to each color plane. Eight color planes would require 8 address registers, which is pushing the limit, and 16-plane color is out of the question. Can anyone suggest modifications that will work for >= 8 color planes?

Thanks,

Tim Gallivan

John Hoffman (jhoffman@netcom.com) wrote:

: Problem with Apples new computers is that it's a dead end system. Apple will
: will be phasing the Mac out as soon as the powerPC hits sometime next year.

: Now with the Atari the falcon will be the computer that Atari is still shi...
: 5 years from now. Think of the savings in money and software. Fact of the
: matter is I'm still using the same ST computer I bought 5-6 years ago. It
: also still does what I need.

You could say that about MS-DOS systems, too. It would be great to be able to use all my old software. But it's a lot of work to keep full backwards compatability while making improvements to the machine. For me, the improvements in hardware and in the OS justify breaking some old software. I would be really disappointed if people still had to work with eight character filenames and three letter extensions.

Power PC isn't going to obsolete the Mac anytime soon. Making a new platform doesn't mean that old software isn't going to run anymore. It's not like the 8-bit to ST transition. Apple's Power PCs will run Macintosh software, without recompliling or modifications. Macintosh is still a real live platform, and Apple will still make Macs five years from now. (And they're all going to be using at least a 68040 processor -- none of that old 68000 stuff).

I just wanted to clear up some misconceptions here. Some people seem to think that Atari's technologies are many years ahead of everybody else's, and that the new machine will make everybody want to go out and buy one. The 1040 ST was great when it was introduced, but other companies soon surpassed it.

What I hope is that Atari will keep improving their Falcon (040 maybe?), so that in five years, Atari might be making that same Falcon030, but they'll also be selling better models (with voice control and video processing, etc.).

From what I understand, the codeheads have turned into snobs.
I haven't seen an Arcshell that is MTOS compatible yet, another editor
of AEO talked to Chuck about it, he got much the same reply.

>If Charles Johnson has promised an upgrade, then he needs to kill the guy that
>I always get on the phone at Codehead tech support. That guy has lost me as
>a customer. Codehead will have to REALLY offer some extraordinary stuff for
>me to ever buy something from them again. Whenever I get a problem, its always
>"MY" problem for me to handle. How nice.

They do sell the #1 piece of atari software don't they? i think its
went to their head, and think they are 'above' atari corp.

As MTOS picks up, hopefully the codeheads will fix their bugs.
Or NVDI will take their market.

As one who has been there, I'll throw in a few remarks.

If your atari has an internal power supply, the ram chips are situated under that. Otherwise, they should be easy to spot.

There are docs on doeing this kind of upgrades. I believe I found one on atari.archive, but I am not sure, and I can't remember neither name nor path. There is a slight chance that I still have it at home, so mail me if you can't find anything.

This doc are quite nice and thorough. It describes a sip-upgrade, but it is easily converted into one for simms.

The easiest project is probably the one where you piggyback your existing chips (puts a similar chip on top), but this can only double the capacity.

If you want the full 4 Meg., I think the SIMM project is the best. It is highly recommended to use sockets for the simms (mounting it on a small piece of breadboard), and remember to work out the new position IN ADVANCE. Space is *very* tight, and you may need to do some nasty things with the metal casing. This is an important point, so you can get the wire-lengths right the first time.

A small multimeter come in very handy, to find missing connections.

Last, be carefull and thorough, and DO NOT solder on your computer with the power switched on. This is (probably) the reason why I succeeded in frying my computer completely!! And it had even been up working.

I don't use GEM very often, but doesn't it use interleaved bit planes? If so the address regs aren't a problem - you only need 2. Data regs are more of a problem but for 8-bit pixels it's quite easy (Does any Atari/GEM machine support 16-bit bitplanes anyway? - Falcons 16-bit mode is chunky). BTW if you code only has to run on TT/Falcons you may be better off using the 68030 bit field instructions; I don't have the timings to hand.

Steven

You need to use the sym-ld program to produce a symbol table (e.g. prog.sym)
and start

gdb -e prog.ttp -s prog.sym

It actually is in the docs, which should be somewhere around on atari.archive,
if it does not accompany gdb.

Whoa... i wouldn't say the CodeHeads have turned into snobs. I've always found them incredibly helpful and I think they are just having second thoughts about supporting the Falcon when Atari gave them so much crap last year.

A good example might be how they were prevented from getting a developer Falcon long after much smaller s/w houses were given developer models to work with. CodeHead Software made the Atari ST series *usable*. Anyone who remembers MultiDesk, MultiFile/MaxiFile, G+Plus, or any of their other utilities probably can attest to that.

I think it is "not a good thing" that they aren't pressed to upgrade their software, but what has Atari done for them?

<unlike other developers, I think the CodeHeads may have reasons for some gripes with Atari... >

3954. 1040 STe power supply problems?

Newsgroup: comp.sys.atari.st.tech

I just heard of a spectacular power supply failure in
a 1040 Ste (sparks, smoke, etc.) with damage extending
to other parts of the computer. Is this an isolated
incidence, or is there a reputation of power supply
problems in the STe? I have a 1040 STf that other
than a resistor replacement has had a reliable power supply
since 1987. I'm upgrading my system, and if its
needed would rather do a preemptive replacement of the
power supply now rather than lose my investments.

3955. Can I use an AMIGA 1080 ana/dig color monitor w/ST comp?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-28 15:33:59 UTC
From: cwilliso@tuba.calpoly.edu
Message-ID: <1993Jul28.153359.180496@zeus.calpoly.edu>
Source record: 37410

I have an AMIGA 1080 ana/dig color monitor with analog RGB, digital RGB, and composite video capabilities. I am already using it with the composite video, but would like to change to analog RGB to imporve the viewing quality but I have a couple questions. First, is the vertical frequency compatible with ATARI's standard -- around 15MHZ? Second, I have no pin-out on the 9-pin plug on the monitor. Is the 9-pin a standard?

Maybee some-one could forward this to an AMIGA newsgroup, as I do not know of any off-hand.

Any help would be greatly appreciated!

Chris.

>>I haven't seen an Arcshell that is MTOS compatible yet, another editor
>>of AEO talked to Chuck about it, he got much the same reply.

Uh, ARCShell is not a Codehead product, it is a Charles F Johnson
shareware product (I think I got his name right). I think Charles is
one of the Codeheads, but like Little Green Selector, it is not
supported as a commercial product (but rather shareware). This is a
minor point, but it does make a difference.

Besides, when there are programs like ARC-G-Shell available (which is
MultiGEM compatible, and I assume MTOS compatible) that lets you handle
ARC, LZH, ZOO, etc files, then in a way there really isn't a need per se
to upgrade Arcshell. Should be at atari.archive.umich.edu if you want
to check it out (I do use Arcshell, as I'm not always in
multitasking mode)...

>Whoa... i wouldn't say the CodeHeads have turned into snobs. I've always
>found them incredibly helpful and I think they are just having second thoughts
>about supporting the Falcon when Atari gave them so much crap last year.

Perhaps an "alternative marketing technique" for Atari? :-) Besides,
the Codeheads sent my Warp9 3.75 upgrade rather promptly as it was
(and a "pun"ny pin with it :-)...

>A good example might be how they were prevented from getting a developer
>Falcon long after much smaller s/w houses were given developer models to
>work with. CodeHead Software made the Atari ST series *usable*. Anyone who
>remembers MultiDesk, MultiFile/MaxiFile, G+Plus, or any of their other
>utilities probably can attest to that.

I think Atari's argument was that "applications sell computers,
not utilities." However, once you've got that system, then Codehead-type
products make a tremendous difference (for those of you with
screen accelerators - imagine life without them, be it Warp9, NVDI, or
whatever). Sales of Falcon's may justify whether the Codeheads should
spend the time and money in updating their software to work with
the Falcon...

Atari should take advantage of the loyalty of developers who've
stuck with the platform (and the users as well) to be more successful,
rather than attempting to be successful in spite of any customer/developer
loyalty. This is something many companies only dream of...

> was or would be an update to Warp9 to make it work with MiNT/MultiTOS. You
> know what I was told? I was told I shouldn't hold my breath!! No upgrade
> at all is planned.

What is so surprising about this? I can understand that you'd be disappointed that they have no current upgrade plans, I'm disappointed too. But at least they were honest and forthright enough to come right out and tell you the truth, without stringing you along. This made it possible for you to deal with your problem immediately, rather than waiting and waiting for an update that wasn't even planned.

> Codehead blamed ATARI saying that resident programs just
> don't work right with MultiTOS because it really "isn't ready" even
> though it's been released.

Isn't it possible that this is, in fact, true?

> I then said, "I hear there is a program called NVDI that works
> fine." He says, "I heard that too".
>
> Now, tell me, if its all Atari's fault because MiNT/MultiTOS are so
> horrible, then why would NVDI work when Warp9 won't ??

Well, NVDI didn't work either, initially. It had to be modified, and perhaps the techniques they used were easier to change than those that the CodeHeads used. Also, the NVDI folks may be more motivated, based on the size of their local market, than the CodeHeads would be based on theirs. Economics is a factor, especially when manpower is limited.

> And I also think its pretty rude
> to tell someone with a problem that they shouldn't hold there breath!!

Personally, I be happier to hear the truth, even if it wasn't what I wanted to hear. It isn't always easy to be honest, especially when you know there's a good chance you're going to get flamed for it.

> What
> choice did I have? Run without MiNt, No way! Run without Warp9, slow, Not
> if I can help it. Run without Warp9, and buy NVDI! Hey, I ordered NVDI !

Good move. And good analysis. For those who want to speed up MultiTOS today, I don't see any other alternative. However, this doesn't mean that Warp9 will never be an option. Perhaps it will become more of a priority for the CodeHeads when there are more than 3 or 400 people in the U.S.

running MultiTOS.

> Codehead will have to REALLY offer some extraordinary stuff for me to
> ever buy something from them again. Whenever I get a problem, its always
> "MY" problem for me to handle. How nice.

Now this is really unfair. CodeHead has been offering "extraordinary stuff" to the Atari community for, what?, 7 or 8 years now? They've consistently updated and upgraded their entire product line for compatibility, bugs, and enhancements all that time. (In fact, they've even been criticized for bringing out updates *too often*!). So if you're looking for someone to bash, you've really picked the wrong people.

You say, "Whenever I get a problem, its always "MY" problem...". So, are you saying that you had many other problems with CodeHead products and gotten the brush off from them in those situations as well? How even handed are you being?

In any event, thanks for sharing the information regarding compatibility between Warp9 and MultiTOS, Evan. That's good to know.

Disclaimer: I don't have any connection to CodeHead, other than being a satisfied owner of half a dozen of so of their products, which have greatly enhanced my enjoyment of my Atari systems for many years.

3959. 50 Hz on SC1224's

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-28 19:18:08 UTC
From: vicb@clark.edu
Message-ID: <1993Jul28.191808.4463@clark.edu>
Source record: 37413

I recently heard (read) someone comment that not all SC1224 color monitors will do a good job of handling a 50 Hz video display...Is there truth in this? I am nearing completion of a program that I have running at 50 Hz (a game) and would like to know if there are monitors out there that will need an alternative mode to run in.

Also, is there a place where I can get .mod file code for play on an STe that anyone is aware of?

Thanks in advance,

Victor Bruhn

Have you tried running it a a .PRG before and after you use Creator? I suspect
the problem is that as an .ACC it is getting into memory problems.

>
That's correct. V2.03 works fine with MTOS while v2.11 doesn't. The
latest version 2.50 works as well. I never liked v2.11, it didn't agree
with ImageCopy which I use quite a bit.

Here are some stats when using NVDI 2.50 on a Falcon. When MTOS is
present there is a 5% slowdown on most VDI calls.

```
GEM Bench v3.09 = Ofir Gal 30.7.93
==========================================
Falcon 030 TOS 4.04, MiNT not present
Blitter Enabled, NVDI 2.50 present
Video Mode = 880 * 656 * 2 Colours
LineF FPU installed
Run and Malloc from STRAM
Reference = F030 + FPU
==========================================
GEM Dialog Box: 1.715 227%
VDI Text: 0.435 881%
VDI Text Effects: 1.120 741%
VDI Small Text: 0.600 710%
VDI Graphics: 2.605 356%
GEM Window: 1.050 145%
Blitting: 1.025 112%

Source record: 37388

In <238beh$1ea2@obelix.uni-muenster.de>, Julian Reschke writes:

[> You'll need assembler or a properly working vq_gdos() (should be there in all
[> current libraries).

In the end, I had to use assembler code to do it. The vgd_detect()
function of HSC always returned zero, regardless of whether GDOS was
installed or not. In HSC, you can use:

```
int check_gdos()
{

/* Purpose: Determine if GDOS is installed.

Return: -2 if GDOS is _not_ installed. Anything else if it
is installed.

Notes: This will generate a warning uner HSC about the function
not returning a value. Ignore it. */

asm("move.w #-2,d0");
asm("trap #2");
asm("cmp.w #-2,d0");

}
```

Then a simple call to check_gdos() will tell you if GDOS is installed.
This is my first attempt at assembly interfacing with C, which is why
I have not found a way to get around the compiler warning about not
returning a value. The register d0 is used to return values, and d0
conveniently holds the result we want, so I just ignore the warning.

[>
[> > Would vst_load_fonts() return 1 if GDOS was not installed (since there
[> > is only one font if GDOS is not installed).
[>
[> Nope. vst_load_fonts() will crash when called without GDOS.
[>

Boy, did it ever...:) I had to turn the machine off to recover from
this one...

[> Robert Burton

Sigh...:) I do not have Lattice C. I use HSC. I did find a way around
the problem, using asm("") statements within a function called check_gdos()
which I posted in another message. Since the result of the Atari
suggested method for checking if GDOS is present conveniently gets placed
in d0, and d0 is used by the compiler to return values, it works. It
generates an warning about not returning values, but I ingore that...:)

[> Yes Michel get rid of that supid C compiler that you uses and use one that
[> supports inline Assem code..:-)..

The above comment was ... beyond description. HSC is a very good "C"
compiler, and costs nothing at all. If you can write a better "C"
compiler, where is it? HSC _does_ support inline assembly code, by the
way. I asked because I do not know much about assembly language
proramming. A user of this network kindly pointed out that d0 is the
register used by most "C" compilers for returning values. With that
information, I was able to use the assembly statements given by Atari to
check for the presence of GDOS (the main thing I could not understand
was how to get the result from the assembly routine into a "C"
variable).

[> Also why would you want to use GDOS with a file Browse util...

There are some very nice fonts out there, which are much more pleasant
to look at than the System Font. Using GDOS does _not_ slow down the
update speed of MasterBrowse noticeably, so I included it as an option.
People who do not want to use it do not have to. The new version of
MasterBrowse also has raster copy screen updates for _every_ resolution,
so the update speed has actually increaed very much. You may not like
GDOS, but what makes you think others do not? I like it, use it, and
decided that I needed it for my text file viewer. Period.

[> My Great File Browse utill is Guck18, give that a try its so simple to use...

I have seen GUCK, but do not use it. It is very small, and does very well
what it says it can do. However, it does not have the features that I
need in a text file viewer. MasterBrowse, however, does.

>difference would indicate the presence of RAM, but it doesn't say how
>much in the ad. Is this the famous GESoft board?

Mighty Sonic is without RAM. Mighty Sonic does allow up to 128 MB
Fast-RAM and has an VME-bus connector. So the price difference between
Mighty and Eagle Sonic is okay. FPU is not included. Prices in Germany:
Eagle Sonic: DM 495, Mighty Sonic: DM 1290.

But: Mighty Sonic does not fit in your FALCON case! You'll have to put
the board into a tower case...

There's a (ST-)RAM-board available now, where you can put 1, 4 or 16 (14
used) MB SIMMs onto. Price in Germany: DM 199.

3966. Objective C

Newsgroup: comp.sys.atari.st.tech
Date: 1993-07-31 22:20:26 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CB1vE4.7Gu@sdf.lonestar.org>
Source record: 37414
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Does anyone know if there is an Objective C compiler for the GNU Compiler? I'd rather go with Objective C than C++ (or G++). Also, would it be possible to create an Objective interface to GEM? Like the NeXT? Perhaps with a Dynamic Link Library (has anyone made a DLL system for MiNT yet?) or maybe a rewrite of the AES to be objective?

It also pisses me off that the AES polls everything. When you press a key or click with the mouse, it causes an interrupt. A keypress should find the application with the top window, giv eit the keypress, and then switch tasks so that when the keypress interrupt returns that application can deal with the key immediately. Same with mouse clicks. Of course, objectively, the "object" should get the events, not the necessarily the application. By task switching with the standard event interrupts I think the system would respond better and would at least seem faster, and should actually use less CPU time since you don't have to poll anymore.

In any case, I would like to learn Objective C for the ST, even if no one will ever fix the OS.

I'm running NVDI 2.12 german version) under MiNT 0.95. Up to now I didn't have any Problems, although I'm using NVDI's GDOS all the time. The newest version of GDOS is 2.5 (or higher), which was released to run on the FALCON. I would suggest it might support MultiTOS, too.

BTW: The only problem I heard of occurs when you try to use NVDI's GDOS and SpeedoGDOS at the same time. But as I'm not using Speedo, I don't know how it can be fixed.

OK, I have GNU C (2.3.2 I think, 2.4.2 when BART gets working again).
Now, I thought that GNU C required G++ (another MB or so of archives)
in order to compile C++ code. Will GNU C compile C++ and Objective C
without these alternate "front-ends" ?? Or will I have to find a front-end
for Objective C.

I have contacted the FSF before when I was tracking down GNU C. They sent
me a little book that gave an InterNet address to contact, and he told me to
FTP a.a.u.e, and i later learned to use BART to get it. I don't remember
seeing an objective C library on a.a.u.e. Is it there, or will i have to look
elsewhere.

Any help is greatly appreciated. Thanks.

Sorry to correct you on this ;-)

The solution is: use another editor to fix up NEWDESK.INF.

Mine mangled the '#d' line i.e. removed the 40 or so trailing
blanks which are used as scratchpad by the AES. :-(

Uwe

P.S.: MicroEMACS acquired a new addict! ;-)

hi!
in the gnu-package there is an objective c-compiler (sorry, i forgot
the name, perhaps objc.ttp??)
just have a look at the readme-files.
bye, mike :-)

3974. Mega ST and SCART TV

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-02 09:08:26 UTC
From: Little John <haines@ccint1.rsre.mod.uk>
Message-ID: <1993Aug2.090826.26944@ajax.rsre.mod.uk>
Source record: 37422

Can anyone tell me how to connect my Mega ST to a TV with SCART (peritel)
and A/V phono inputs.

I have already tried the phono, and I get very dark grey text on a very slightly
lighter grey background which is totally unusable. The RGB in is even worse.

The TV senses the signal, but it doesn't work properly.

For details, my TV is a Sony Trinitron KV-M2130U, my ST is a Mega (UK version)
and the pins I use on the SCART are: 21, 20, 16, 14, 2, 17, 15, 11, 7, 5

Many thanks in advance

Little John <haines@ccint1.rsre.mod.uk>

This has been fixed. It works well with Speedo.

From: Christoph_Wissing@st.maus.de
Message-ID: <A6634@ST.maus.de>
Source record: 37323

S>Does anybody have any info on the Mighty Sonic board for the Falcon? It is
S>said to be an accellerator/memory upgrade board. Does it have 32bits
S>fastRAM?

In a german ad Mighty-Sonic costs 1290,- DM, and they announce:

"32 Mhz, up to 128 MB FAST-RAM, VME-BUS-Connector".

btw, the Eagle-Sonic costs there "only" 495,- DM, about 550 HFl.

Another accellerator is advertised, too:

"Skunk32" 398,- DM (US$235), 32 MHz 68030

(but it sounds like they use the old _16_ MHz 68030 for this purpose...)

Ciao, Christoph.

>tasks in parallel, e.g, other users's benchmarks)?
>
>Do You think this group is the right place for such a posting? Isn't
>comp.benchmarks more appropriate?

The times were simply timed using my watch and are approximate. As I am the only
user on my machine, then it should be pretty accurate. And I just realised that
I had compiled without optimisation on the SUN.

IPX without optimisation : 24 seconds
IPX with optimisation : 13 seconds

Aw well, it was worth a try...

And yes, this probably should be in another post group, but it was part of a reply
to someone who was upgrading to a more powerful machine than the 520 STFM, and since
I had done the same thing, I was suggesting that he/she should look around first.

Get Protracker 20S (pt20s.lzh) from ftp.uni-kl.de (in the atari/STE directory,
I think). It includes source for tracker routs.

BTW, this is the best mod player for the ST, STE, TT that I have seen. It
claims to be superior to the latest Amiga Protracker (their claim, not mine).
It sounds better than any of the other mod players I have, and it works
fine off my hard disk (all the others that I have used are buggy). It is
shareware (8 pounds UK).

The numbers are the time took in seconds and ratio compared to a clean system. A figure of 200% means that with NVDI the falcon performs the same operation twice as fast.

3983. (re)drawing icons

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-02 23:26:40 UTC
From: jansteen@cwi.nl
Message-ID: <10835@charon.cwi.nl>
Source record: 37431

I just added icons to my application by creating object's with the
"ob_spec" field pointing to an ICONBLK type structure, and setting
the "ob_type" field to G_ICON:

```
OBJECT *
icon_new()
{
OBJECT *o = calloc(1, sizeof(OBJECT));
ICONBLK *i = calloc(1, sizeof(ICONBLK));

[...]
i->ib_pmask = my_mask;
i->ib_pdata = my_data;
[...]
o->ob_type = G_ICON;
o->ob_flags = LASTOB;
o->ob_state = NORMAL;
o->ob_spec.iconblk = i; /* ICONBLK struct */
[...]

return o;
}
```

I display the object using:

```
/*
* Macros to save typing and avoid typos as well
*/
#define SETARG(n) n[0], n[1], n[2], n[3]
#define GETARG(n) &n[0], &n[1], &n[2], &n[3]

icon_show(icon)
OBJECT *icon;
{
int rect[4];

/*
* icon_rect() below, will deliver a pointer to the
* location and dimension of the icon object
*/
memcpy(rect, icon_rect(icon), sizeof(rect));

form_dial(FMD_START, SETARG(rect), SETARG(rect));
objc_draw(icon, 0, DEEP_ENOUGH, SETARG(rect));
}
```

After having implemented all this, I noticed while testing the program that the graphical instance of these objects are disturbed by window movements on the screen. So, what was basically my faulty assumption is that the screen manager doesn't redraw these icon objects for me.

Then I started to think about this problem for a long time and also looked around in books (Profibuch and Programmers guide to GEM) to find an answer for this problem. I even checked the Atari archive (atari.archive.umich.edu) to find some icon sample code but, you guess it correctly, I didn't.

How should I solve this problem:

1. I can't track all window movements on the screen. First of all, this will be a boring programming task, but even worse, it will not protect the icons against accesory windows popping up on the screen (my application will never know about them).

2. I could put them in windows, but then the main reason for having them in the first place (more than 4-8 instances of data) would be defeated. Also, each icon will at least have the window border showing around it.

And here I ran out of ideas... Is this a case to use the G_USERDEF type object maybe? I can't see how. Can someone help me out?

3984. How to Legally do Raster Ops under AES

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-02 23:51:22 UTC
From: cmedley@wam.umd.edu
Message-ID: <23k99q$4gq@cville-srv.wam.umd.edu>
Source record: 37432

I'm trying to stick to legal methods to do a vro_cpyfm (AES raster operation) inside a program, and I don't see where I can derive information about the screen from info via vq_extnd() that helps me figure out:

- the address of the screen memory
- the width of the screen in 16-bit words

I could use the Line-A to determine this, but I'm hoping to stick to using the AES. I can't find any examples of code that do raster operations anywhere that DON'T hit the Line-A or hardware somehow. These examples, however, are pretty old (pre-1990). Does anyone know of a way to legally determine these values?

3985. help with sc1224 monitor problem

NVDI has to be in the AUTO folder before SpeedoGDOS. Then the GDOS of
NVDI will switch off automatically. This works fine with NVDI 2.5 (does
not only work on a FALCON!) and SpeedoGDOS on my FALCON.

I this doesn't work, you can use NVDIFLT (not NVDICONF.CPX/ACC!) to switch
off the GDOS of NVDI permanently.

I just recieved NVDI today. It's version 2.11. Is there a newer version? I'm using MiNT 1.04 and they work GREAT together. I even dumped the version of AMCLITE I was running since NVDI has it built in and NVDI's GDOS can be turned off. Warp9 is a thing of the past!! All I need now is a way to put my own fills and pictures on the desktop and a good modular screen saver, and I'll never miss Warp9.

If my version of NVDI is old, what are the new features/bug fixes, and is there a cheap upgrade path? Should I send my NVDI back top Toad computers and demand the new version? Also, what does "Gekauft bei" mean? My registration card is in German and that is the only line I can't figure out.

As a word of advice to NVDI users. Get Let'EmFly. It speeds up dialogs a bit, especially if you turn off the hot-keys and and turn off the grow/shrinks. Its just slightly faster than Warp9's dialogs, and of course, they are movable. Let'EmFly is NOT faster than Warp9 without NVDI, just slightly faster than TOS, but the new AES routine in Let'EmFly seems to be what NVDI needs.

Does anyone know if the system font can be replaced by a proportional one??

CYA

>values?

you don't need these values at all.

to copy from screen to ram it shoould look like:
mfdb_src.fd_addr=NULL;
(don't touch anything else in that structure)

mfdb_dest.fd_addr=(somewhere in memory);
(fil out the rest of the mfdb_dest struct)

to go from ram to screen:
mfdb_dest.fd_addr=NULL;
mfdb_src.fd_addr=(pointer to bitmap);
(fill out rest of the mfdb_src struct);

using NULL in the fd_addr for the screen side of things tells the VDI
to grab/put the data to whereveer the screen might be, even VRAM
on a video card.

the VDI will fill in the rest of the MFDB for you.

Hi I have just had a play with the latest version of FLASH II,
I just got the Patches down from GEnie for a friend, it is
now upto version 2.11...

I have never realy played with it before, the reports that I read
about it and the comments from Alan Page put me right off,
Alan mentioned that it had the same flaws as FLASH 1.6..

I as I had the latest version I though that I would give it a try out...

Yuk it has more Bugs than Features, the Zmodem is SLOWWWWWW 1000cps
with a 14.4bis modem, I normanly get 1640, the screen writes are slow,
no support for sending a ESC key code, used on many BBS's, its used as a clear
key, no support for C-Kermit, only Kermit, and you have to manualy select
Terminate after logging off a BBS...

From what I have read the Zmodem is a old version taken from the PD source
code that has been posted around, there is a TX delay after each TX block..

So Please were can I get a real GOOD Terminal program, Connect
is no good, no support for medium res, and Stalker is very slow and has some
bugs from what I can make out...

I like the Flash concept, the only one that has come near is Trapido...

Roger.................. sheppard_r@kosmos.wcc.govt.nz

You don't have to figure it out yourself, just set the address in the
MFDB to NULL, and the VDI automagically uses the correct screen
parameters in vr[ot]_cpyfm.

The function vro_cpyfm() is a VDI call, not an AES one!

If you are using the screen as an MFDB, all you need to do is set the
fd_addr field to 0. The VDI copes with the rest.

You never need to know the screen address, or the screen width.

--Chris

PS: How big does a memory form need to be in the Falcon higher-colour
modes? And how does an app know it is in a higher-colour mode?
(Higher-colour == 16 bits/pixel and above) Thanks!

3993. Wordplus device drivers

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-03 11:29:01 UTC
From: bayerr@glas.rtsg.mot.com
Message-ID: <1993Aug3.112901.897@glas.rtsg.mot.com>
Source record: 37344

Hi,

I'm having some slight problems with the printer driver for 1stWordPlus.
I'm using a pretty ancient version of 1stWordPlus (2.11 or something),
and although I specified 0 in the six'th number of the general printer
parameters, the window prompting me for the next sheet of paper still
comes up.

Furthermore, I also have to select 'Neustart' (restart) in order to
print the next page, instead of 'OK' which the manual says.

Am I doing anything wrong or do I just have an outdated and buggy piece
of software?

Cheers,
Ralf

3994. GDOS device drivers - how do they work?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-03 11:34:25 UTC
From: bayerr@glas.rtsg.mot.com
Message-ID: <1993Aug3.113425.982@glas.rtsg.mot.com>
Source record: 37345

How does a GDOS device driver work? I know it has to be mentioned
in ASSIGN.SYS, but that's all the information I could get from
reading several otherwise pretty complete books and scanning
numerous magazines.

Specific questions are:

How is it invoked and how does it install itself?
What requests does it get from GDOS/VDI to produce some output?
How are those requests transferred?
How does it handle font files?

The best thing would be an example, but that's probably too much to ask.

Cheers,
Ralf

No support is a little overstressed. In fact it runs pretty well unter
medium res but its not that nice as in higher resoltions. At least
CoNnect's internal Z-Modem is very fast. On a TT or Falcon it rates
up to 11000 Cps when null-modeming on a 115200 line.

There is a bug in some versions of NVDI 2.5 that prevents it from
running with Speedo GDOS. Wilfried released a patch for this problem.
I do not have the file at hand, but I could send it to anybody who
wants to have it. Besides, there are some more problems with NVDI,
since it does not recognize all of the more esoteric new Setscreen
calls. I wrote a small bug fix that has to be started after NVDI if
these bugs occur. Hopefully these bugs will be removed in future
versions of NVDI (as of now, Wilfried is still waiting for Atari's
official documentation on the extended calls).

Feel free to contact me at Markus.Gutschke@uni-muenster.de

3997. Help with MWC Fseek?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-03 14:25:38 UTC
From: hansen@sol.cs.wmich.edu
Message-ID: <1993Aug3.142538.1315@sol.cs.wmich.edu>
Source record: 37343

I have an old copy of Mark Williams C, that I need to use for a while.
Unfortunately, I cannot find my Lexicon, packed up during my last move.
I cannot recall the exact order for the parameters of Fseek(), and experimentation
has only generated more confusion.

I am fairly sure that Fseek((long) Offset, (int) Fileno, (int) Base)
is the correct order, where

Offset is # of bytes to move
Fileno is the file handle (NOT FILE*)
Base is 0 for from beginning
1 for from current position
2 for from end

Using the parameters in this order seems to be the only way to get *some*
effect on the file position, but I am getting back *negative* numbers from
calls to ftell() after most of the calls to Fseek(). Some of the calls to
Fseek() return 0, and some of them return -1.

Anyone able to help?

Thanks,

Karl C. Hansen
hansen@cs.wmich.edu

Off the top of my head
The parameters are in the same order as 'fseek' :
int fseek(FILE *fp, size_t offset, size_t whence);

except the file pointer is replaced by the file number.

int Fseek(int fileno, size_t offset, size_t whence);

Brian

I use Uniterm 2.0e015 and the GEM sz.prg rz.prg package (the one that is
included with rufus or Connect, I cannot remember). I wrote two small
macros to invoke sz and rz from the Uniterm popup menu. It works great for me.

Uniterm is the best vt100 emulation I have found in any terminal program (on
any type of pc). My only complaint about Uniterm is that it uses its own
custom drawing routines to improve upon vanilla TOS calls. I would like to
be able to disable this behavior (as Neodesk allows you to do), and let Warp 9
speed things up. Uniterm's drawing routines are quite fast, but I would bet
that Warp 9 could do better.

As about 80% of the time I spend in front of my ST is spent modeming into
the systems I administer, I feel that I have given Uniterm (and GEM rz/sz) a
pretty good test. I have yet to find any bugs in this setup. As all the
stuff is readily available via ftp, I suggest you check it out.

4000. Running a program in a window?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-03 19:26:23 UTC
From: paul@charlie.ame.arizona.edu
Message-ID: <1993Aug3.122623.4687@arizona.edu>
Source record: 37351

The solution to this is probably simple, but I can't manage to do it: How do you run a program (eg, .TOS, .TTP) within a window from another program. I've tried using the EXEC command from GFA Basic, but it always puts the .TOS program in the full screen.

-thanks

Paul Harris

It's the power supply; the supply is designed so that a certain solder joint breaking can shut off a regulating circut, causing smoke, sparks, etc. Furthermore, the heat sink is mounted on this circuit board, causing continual bending, encouraging the critical solder joint to break. It's simply poor engineering. :-(

If you catch it in time, a simple bit solder can fix the problem. If you're interested in pre-emptively re-soldering the joint, I can get you specifics. Given what 1040s are worth, I don't suggest getting a new power supply.

Use the wind_set(WF_NEWDESK....)

You can use form_dial() to redraw, and it will 'damage' all windows so you will get things redrawn by the dektop, but also any overlying windows. Of course you get the merging, but a better way i find is once again to redraw directly. You can still use the window rectangle list for handle 0.
Mind you, with MTOS installing desktops is a bit anti-social, but that's another matter.

Adam.

>2. I could put them in windows, but then the main reason for having
> them in the first place (more than 4-8 instances of data) would
> be defeated. Also, each icon will at least have the window border
> showing around it.

Here are two solutions:

1. Create a user-defined desktop form. Read your books to
see how to do this. Basically, you can set the
desktop to any form you like, and the system handles
redraw of that form.

2. Put them in windows (your (2)).

The trouble is that under MTOS, (1) isn't very friendly. (2) is a good
option. You could put all icons for your application in a window (in
the way the desktop put file icons in windows).

> - the address of the screen memory
> - the width of the screen in 16-bit words

I assume your are dealing with the "MFDB" data structure, and the "fd_addr"
and "fd_wdwidth" fields.

The solution is to set "fd_addr" to 0. This indicates that you want to
use the device (screen) itself as the source/destination.

Now, you'll probably have no trouble after that. However, you should
use the vr_trnfm() function to convert your off-screen bitmaps from
"standard form" (which is known) and "device dependent form", which
will depend on the display/graphics-card (eg. some modes use
interleaved words, other separate bitplanes, others packed bits).
I'm not an expert on this latter problem (I've only done it once -
with GEM NetHack - and I got that wrong a couple of times). I still
don't understand how the palette comes into it: how can you convert
a standard form bitmap into a TrueColour bitmap without also passing
the palette???

Hmmm, this message can't be correct. I use Flash II every day with unix computers. Using sz and rz on a unix system with a 14.4 modem on both ends I get 1600+ xfer rates all the time. Occasionally I may get slower speeds but that isn't flash. V.32bis modems occasionally will back down the transfer rate if the line quality is bad. My modem supports a speed status at command. One time I noticed my transfer rates were slower than normal so I type +++ and check the status. My modem was communicating with the other modem at 7200 baud if I remember correctly. Also Flash II has no problems with the esc key. Lord knows using VI I go ballistic if the esc key didn't work. And as for screen updates. The speed isn't quite as fast as the old flash or uniterm but it certainly couldn't be called slow. I've tested the screen update speed on my system with warp9 and find that it will just fall short of keeping up at 9600 baud.

Now there are some bugs and problems but so far Missionware has been very responsive in correcting known bugs.

UniTerm has still problems with double height characters and reverse
scrolling in scroll regions. Sure it is a very good vt100 emulation but
CoNnects vt100 has proved in many tests to be superiour. Concerning
speed up by Warp 9 CoNnect also will allow significant results there
as it completely relies on GEM and VDI.

I think we had this discussion already. As CoNnect is able to use GDOS
fonts even without GDOS its just a question of you beeing able to install
a proper GDOS font for 80x24. There exist fonts which are very readable
even without magnifying glasses.
Obviously you still haven't been able to read the online help in the
new version of CoNnect on how to install the fonts though the online
help is in English.
Taking this into account I really don't know how to help YOU. But there
are other very contempt medium res users haven 80x24 (without using
magnifying glasses) and it would be very kind of you stopping this
statements as this seems to me to be some personal problem of you.

>Mahon Industrial Estate Phone: +353 21 357 101
>Cork, Republic of Ireland FAX: +353 21 357 635

May I recommend the following two items:

1) COMPUTE!'s Technical Reference Guide Vol 1 VDI
Author Sheldon Leemon ISBN 0-87455-093-9
(contains all VDI calls)

2) Fontkit Plus V3.4 Sterling Pounds 19.99
Author Jeremy Hughes
The ST Club, 2 Broadway, Nottingham, NG1 1PS UK
This has a 250 page A5 binder describing in great detail the use of fonts
and conversion programs for the popular wp programs. The Fontkit program
is required for designing and converting fonts, and it allows you to load
and unload drivers.

The VDI driver program is a subroutine.

The driver program is entered with the value of $73 in register d0 this is the
VDI call command, register d1 contains a pointer to a block of 5 longword
pointers (contrl,intin,ptsin,intout and ptsout).
contrl is a table of 16 bit ints.
contrl(0) contains the command to execute (ie v_opnwk opcode 1)
contrl(1) number of points in ptsin

intin(0) Device ID number (defined in the ASSIGN.SYS file)

The driver will have to find the required command and execute it. For
example the v_opnwk command could reset a printer and do a form feed.
It should also return information about the capabilities of the device. As well
as contrl(6) - device handle for the device. (copied from intin(0) perhaps?)

If you write the driver in assembler just compile it and change the file name
to MYDRIVER.SYS or whatever.

If you write the driver in C you will require a startup stub to link with your
C code. ie in LATTICE C the default 16 bit is a short.

```
mydriver(short *contrl, short *intin, short *ptsin,
short *intout,short *ptsout)
{
/* all the good stuff here */
}
```

The startup stub will have to sort out the pointers and put them on the stack
or whatever your compiler does before calling your routine.

You will require the GDOS program or something similar (AMCGDOS, NVDI etc)
In the ASSIGN.SYS file include your driver and fonts that the driver requires,

```
; screen drivers are 0 to 10 and reserved by ATARI
; printer drivers 20 to 30
21p NB15.SYS ; the driver for the NB15 printer
GGGG10.FNT
GGGG12.FNT ; fonts the NB15 driver requires
;
22p MYDRIVER.SYS ; the driver for your device
MYDRV10.FNT
MYDRV12.FNT ; fonts for your driver
```

It should be possible to replace an atari screen driver with a driver
for your screen device (ie for ST medium resolution -> 3p MYDRIVER.SYS)

I hope this helps, Any inaccuracies are entirely my own no help from ATARI
at all!!!
All corrections welcome.

regards
Dennis

Wolfgang...NO NO NO..!!!

What we wan't is a REAL Comms program, one that can do 80 * 24 using
the System font with medium res...!!

On the lines of FLASH 1.6-2.22 not what you are trying to fource us to use,
when you give us a FULL screen option with Connect then I will buy it, so
please don't dictate what we wan't, we are the users..

If FLASH/TRAPIDO can have a full screen so can Connect, so please give us what
we wan't..??

I have found no one here that likes Connect at all, we have been used to FLASH
for so many years and FDT is used here a lot also, so you need some thing that
is better than those to sell here, Connect is not better its that simple...

I do sugest that you read some of the Files on GEnie, the Archive
round table ones about FLASH II, many of the comment are about the slow speed,
Zmodem also problems with the the ESC key, so I don't think that I am making
it up, try placing the ESC key command into a Auto log on script...

My modem Supra, tell me the speed that I am connected at, I also tried
using FLASH 1.6 and RZ/SZ 3.4 and got 1600 cps after loging off with FLASH II..

My Post here was just confirming the comments that I have read on GEnie...

Thanks for the input. I'm definitely interested in the preemptive
soldering details when you have time. I understand
the 1040 ST/STe is old technology, but right now it's the core of
our home computing until we save enough for some other platform, so
I'm willing to invest time and (some) money in it. I've not noticed
a heat sink; what's it look like?
(I tried mailing directly, but it bounced; hence this update post)

4018. Hooking up SCSI Hard Drive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-04 13:19:30 UTC
From: Paul Purdom <pwp@cs.indiana.edu>
Message-ID: <1993Aug4.131938.1186@news.cs.indiana.edu>
Source record: 37367

I have an ICD tape back up unit which has provision for hooking up a SCSI hard drive. Can some kind soul tell me what I need to buy and do to hook a hard drive up to this unit. (General advice on hooking up hard drives to SCSI ports also welcome.) I expect that if I am able to do this then I will give my old hard drive to a child, so the new SCSI drive will be the only one on the system.

Thanks.

I was hoping that was what that meant, but I was afraid it was similar to
QuickIndex, which uses the numbers of a stock ST for it's comparision.

Thanks
Brian

>What we wan't is a REAL Comms program, one that can do 80 * 24 using
>the System font with medium res...!!

This is your needs for a comms program. This, however, does not
mean that Connect is not a "real" comms program, only one that doesn't
suit your needs. I've found many features in Connect that suit *my*
needs much better than other terms, but that is my situation...

>On the lines of FLASH 1.6-2.22 not what you are trying to fource us to use,
>when you give us a FULL screen option with Connect then I will buy it, so
>please don't dictate what we wan't, we are the users..

Uh, who's forcing you to use anything? That's the beauty of shareware:
you try it out, and if it doesn't suit your needs, so harm done. And if
it does, then things are cool. On a stock [Mega]ST/e, running in
mdeium with Connect probably isn't the best thing in the world. Running
in mono (as I do) is quite comfortable, and I'd imagine using one
of the TT/Falcon's modes would be downright great. A full screen option
would be nice, but then you may lose some of the other features of
Connect (this would apply mainly to MegaSTe/TT/Falcon users who
can have different serial ports connected to different windows at the
same time - something a little trickier to do in one screen).

On Wolfgang's point of view, he would have to find it so that
"if a full screen option were present, then Connect would significantly
be enhanced and sell better." If he's getting a good response
already, then he may see no need to add it. It would be nice to have,
since that seems to be the specific complaint about Connect, but
as for now ain't so.

>If FLASH/TRAPIDO can have a full screen so can Connect, so please give us what
>we wan't..??

See above paragraph. What Wolfgang would have to weigh would be the
advantages of adding a full screen mode vs his windowed mode. The
windowed mode would work better for multitasking systems, which Atari
seems to be headed towards. Of course if the demand were there,
then perhaps a lot more registrations would come in if the option
were present.

As a note on full screen. Before I switched to Connect, I was an
avid Uniterm user - it was (and really is) one of *the* best term
emulators, at least in the VTxxx realm. It was full screen. When running
under MultiGEM, I could use Uniterm, but I would have to switch to

the "drop-down menu mode" (hit the HELP key) to be able to switch to
some other task. This was a pain, but it did allow the multitasking.
Who knows, that could even be an option if Connect were given fullscreen...

>I have found no one here that likes Connect at all, we have been used to FLASH
>for so many years and FDT is used here a lot also, so you need some thing that
>is better than those to sell here, Connect is not better its that simple...

Um, a little presumptious, eh? :-) I've learned one thing - it's
dangerous to generalize a group of people, because some
smart aleck (me for instance :-) proves the rule is not correct.
Anyways, I like Connect a lot, mainly because it suits *my* needs.
I have a MegaSTe, and like to use the higher baud rates of the modem2
and serial2 ports - Connect lets me do this. Connect lets me change
the fonts, which is nice (you could use Warp9 to change the system
font when under Flash, for instance, but the fonts would take up the
same space). I multitask under MultiGEM, and am planning on getting
MultiTOS and/or Geneva - for me Connect seems to be designed to
work under such an environment. The unix-shell is helpful to me,
and various other options are also nice. The fact that I can do just about
anything in Connect *with the mouse* (rather than having to hit function
keys, etc) makes life more convenient for me. My needs are met and
exceeded.

And I do run Connect under a variety of situations: BBS's (VT52 and
ANSI mode), unix boxes (VT100 mode), GEnie, etc.

Your primary need (from your message) seems to be full screen. As such,
Connect doesn't suit your needs. That doesn't mean it's useless,
just not of use to you. If anything, Wolfgang may wish to find a
more tactful way of saying this, but the idea is there...

I do have Flash 1.6 in my collection of stuff (store bought, along with
a couple other disks of misc shareware terms that I don't really use)
and I just didn't take to it. It's hard to describe, but it just
wasn't what I was comfortable with. And so, Uniterm was my choice for
awhile. Does that mean Flash is worthless? Nope. Just not useful
to me...

4022. << What is Atari's Horiz freq? for color RGB in 1040? >>

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-04 16:39:34 UTC
From: cwilliso@tuba.calpoly.edu
Message-ID: <1993Aug04.163934.136851@zeus.calpoly.edu>
Source record: 37372

I tried to connect an AMIGA 1080 RGB monitor to my ST, via a 'custom' cord, but I ran into a couple of problems.

I hooked up 1) RED signal 2) GREEN signal 3) BLUE signal 4)GROUND, and then I noticed that the ATARI has a Hsync AND a Vsync, whereas the AMIGA monitor has only a SYNC. The amiga uses the standard 9-pin RGB standard. I tried connecting the SYNC signal to the HORIZ SYNC (pinhole number 9) on the ATARI monitor plug, but got a sort of ODD picture (it was twisted in the center.)

(AMIGA 9-pin RGB pinout)

pin 1 = GROUND pin 6 = NOTHING (analog) / INTENSITY (digital)
pin 2 = GROUND pin 7 = SYNC (analog) / NOTHING (digital)
pin 3 = GREEN pin 8 = NOTHING (analog) / HSYNC (digital)
pin 4 = GREEN pin 9 = NOTHING (analog) / VSYNC (digital)
pin 5 = BLUE

What am I doing wrong here. Atari uses analog format RIGHT!? Maybee the Horizontal freq. on the monitor is not low enough for the atari. Maybe I'm just not seeing it right.

>I am looking for an inexpensive HD a starters HD. I am looking for a used
>maybe 20m or more CHEAP!!!

You might want to try rolling your own. It is very easy for the ST. You
need:

A host adaptor
A power supply
An enclosure
A SCSI drive

I recommend the ICD Host adaptor. It has (IMHO) the best software, which is
updated frequently (and available free). They also provide a very easy way
to add a battery backed up clock to your ST (if you don't have one already,
they can be bought with or without the clock). I also like ICD's because they
report any "sense codes" the drive communicates to the user. I have only
seen one ("read error with recover", induced by dropping something heavy on
the desk while the hard disk was reading), but I find it reassuring that
any weirdness at the device level is reported directly to me (it pops up in
the corner of the screen, by the way). Price is about $80 at last look.
Without the clock, you save $10. Order the SCSI connector cable where ever
you get the host adaptor, and make sure to ask for a dual drive one with a
red wire denoting pin one (to make the installation easier).

Power supplies are cheap. Just pick up an old XT power supply for ~$30 from computer shopper. If you can find a junked PC, you can get one for free.

Enclosures can also be cheap. You can buy one of those huge old style XT cases for about $30 from computer shopper. This will hold all the hard drives you will ever want! Buy a tower stand for $5 and stick it on the floor (the ICD cable is nice and long for this). You can also go all out and buy an enclosure which will fit under your monitor (mine houses 2 5.25" devices, has a front mounted lit power switch, mates perfectly with the ICD board, etc) with power supply for about $125. There are several places that sell these for the ST, two being Toad Computers and D&P Computer Supply. Email if you want their 1-800 numbers. Again, a junked PC is the absolute cheapest way to do this. If you can get ahold of granny's old IBM XT, you are in fat city. A nice side bonus is that the old PC motherboards make great wall hangings (big fat traces, lots of chunky looking components). Old PC's are really easy to find, now that everyone is going to 80x86 machines.

Now, the SCSI drive. These can be bought from computer shopper. All you need is a bare SCSI device, no other boards or anything. The ICD host will work with just about anything, but there is a very large list of already tested drives that comes with the host adaptor (which I could probably email to you also). Drives are very cheap nowadays, and if you want to really save money you can get a refurb. Several of the refurb places will guarantee their drives for X number of years (X varies with the particular company), so they can really be the way to go.

Anyway, you will now have your hard disk. You bolt down the drive and host adaptor (you can drill some extra holes in the case, or use wire-ties or whatever), connect the two, plug in the power cords (the ICD comes with a little splitter which connects to a standard PC type power cord), hook up the DMA, and boot up. It is very simple, and is not easily botched up. You only need to pay attention to:

SCSI id jumpers set to some reasonable value
SCSI terminator pack plugged into the drive
SCSI connector from drive to DMA is right side up on both ends
Nothing wiggling around

The first two can be checked via the manual that will accompany the drive (make sure you ask for one, some places assume you already have one), usually a 1 page Xerox. The third can be verified by checking that the red wire side of the ribbon cable is near pin one (which is marked on the board either by a number or by a square solder hole instead of a round one). If the cable is in backwards, the red end will be at the other end of the connection (quite often it is pin 2 that is marked, but you only need to know which end of the connector the numbers start on, and match it with the red wire). These are the only two possibilities. You cannot mess up the power connections or the DMA connection (they won't go in wrong).

The reason you wanted a dual drive cable is so you can easily add another device in the future. You merely have to plug it into the other receptacle on the cable, remove the terminating resistor pack off the middle drive on

the cable (the one on the plug closer to the computer), and check to see that the SCSI id jumpers are set to two different numbers. Oh, by the way, the ICD supports the Syquest SQ555 (the 44mb removable cartridge drive) without any special concerns. Since the Syquest is a SCSI device, you can hook one of these up just a easily as you could a regular fixed disk drive. These only cost about $320 bucks nowadays, with 44mb cartridges going for ~$60.

It really is easy, and there are plenty of computer tinkerers around to look over your shoulder and verify what you do. You can also use a setup consisting of a host adaptor, SCSI controller board, and ordinary PC type hard disks, but you add complexity to the system and lose performance this way. Straight SCSI is much cleaner, and usually much faster (SCSI devices have their controller boards "built in", communicating with the SCSI standard).

If you do get a hard disk, you should immediately buy Neodesk 3 and the Universal Item Selector III. They will make life much nicer. Also, beware of buying too small a hard disk. Megabytes are like potato chips. I have a buddy with a 105mb quantum drive, a 320mb Hitachi, and a Syquest SQ555 with 6 cartridges all hooked to his ST, and he still complains about not having enough disk space! I have not yet gone that apeshit, but I think Mr. Visa might have to talk to Syquest Corp. pretty soon. Oh, notice the my friend above has three SCSI devices hooked to his ICD. This just requires a 3 plug cable. The ICD can support 8 SCSI devices, and you can hook up multiple host adaptors if you really need to (like if you get given a box of 10mb SCSI drives :-).

Please feel free to email questions. The above is IMHO, direct flames elsewhere.

] I think we had this discussion already. As CoNnect is able to use GDOS
] fonts even without GDOS its just a question of you beeing able to install
] a proper GDOS font for 80x24. There exist fonts which are very readable
] even without magnifying glasses.

Anyone want to tell me where to find one?

] Obviously you still haven't been able to read the online help in the
] new version of CoNnect on how to install the fonts though the online
] help is in English.

It's pretty difficult to get it wrong! Put the file in the GEMSYS folder,
put the filename in ASSIGN.SYS, and it's loaded. However, none of the
fonts I have are usable in anything less than 10-points! Speedo-GDOS
fonts are a lost cause, the smallest they are usually readable is about
12-points! :)

It's a good little program, if I had a faster machine (GEM's speed doesn't
help things), and a good 8-point GDOS font, I might use it.....

> there are some very contempt 80*24 users......

My point exactly..... 8-) (Sorry!)

I can quite clearly remeber this point being answered by a couple of
people. The point is that *MOST* people *CAN* access atari.archive
through FTP. If you look back at the postings in this group in the last
couple of months, you will see quite a few comments to the effect that
people have had trouble connecting to a.a (This means by FTP!!!) because
it is so busy!! This suggests that a lot of people *ARE* using a.a quite
happily, totally unaffected by BART's problems. Just because *you* can't
access a.a does not mean "most people" can't access it!!

>I know this statement could upset the people on A.A. but I thought
>that the Atari community deserve a far better mailer than the one that is
>presently used on A.A. , I thought this the MAIN ATARI/ARCHIVE FTP site,
>but it has the worst mailer..

By far the vast majority of FTP sites that I have come across (I'm not
just talking about the handful of ones with Atari stuff on them) do not
have any associated mailserver at all! The standard thing to do if you
are one of those wanting stuff through mail, is to use one of the
ftp-mailservers which connect to _any_ site and send the stuff back to
you via mail. ftpmail@decwrl.dec.com is the most famous of these but
there are others. If you don't understand the way things like this work,
read the newsgroup alt.internet.services or the book "Zen and the art of
Internet". The information is out there but you have to look for it.

>I don't know what other peoples fealings on this, but I have stuck my head out
>in what I think...

If you still don't know what people think, you can't be reading what people have been saying!!!! I can't put it clearer than that.

>Why can't A.A. implement the same kind of mailers that are used on most
>European FTP Sites...

I don't claim to be the correct person to answer this, but a couple of things stand out. First, atari.archive is not the only archive based at umich.edu, therefore I guess resources there are likely to be quite stretched at times. Secondly, a.a is staffed and run by volunteers who have to implement these sorts of things themselves. The fact that there is a mailserver just for the use of the atari community is itself quite unusual, the one at tu-berlin and others like it in europe, are used to cover the complete FTP site, not just the atari area.

Cheers,

>we wan't..??

For a comms program to do what flash/trapido (or Uniterm for that
matter) does, it needs to reserve the whole of the screen for itself.
This makes it extremely unfriendly to the newest developments like
Multi-TOS etc. Atari is telling developers to either use GEM with
windows, or totally the opposite with TOS text programs (so that they can
be run inside windows with smaller fonts), so that they can run in
multi-tasking and mixed interface environments. Older types of program
will only run properly on the older computers. This is a fact of life!!
Therfore you can't expect someone like Wolfgang who is trying to make
the next great comms program for today, to go the way of the old ones!!

>I have found no one here that likes Connect at all, we have been used to FLASH
>for so many years and FDT is used here a lot also, so you need some thing that
>is better than those to sell here, Connect is not better its that simple...

No-one where??? This newsgroup is often full of people saying how much
they like it!!! If you mean nz, well I for one like it, even though I
havn't got a powerful enough machine to fully utilise it. CoNnect even
so completely beats Flash or FzDT. They are just not able to handle the
ANSI/VT-100/102 stuff adequately for me.

Cheers,

Won't this yield an incorrect value, unless I am in monochrome? For example,
if I am in a 16 color screen (4 bits per pixel), and i have a 640 pixel
wide display, my screen should be (640*4)/16 = 160 words wide, right?

How is your Atari so different from these new Macs? A Mac is useless as
soon as Apple stops selling them? I guess all those Mac LC users are
fumin'...

Maybe in five years Atari will have a 68040 machine. :-(I want one
now.

4031. Seagate ST-157N Hard Drive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-05 02:50:00 UTC
From: wojci_g@pavo.concordia.ca
Message-ID: <4AUG199321502176@pavo.concordia.ca>
Source record: 37380

So far I found out that the hard drive that I have inside of my Mega STe 4 is a Seagate ST-157N. Since it's an SCSI drive then the controller card should support any other SCSI hard drive of the same size. Now, in concern that I might damage something inside my computer (my experience in electronics is close to nil) I never did open my Mega STe 4. I would like to upgrade this ST-157N to something with greater capacity but before I do that I would like to know what size and what type of hard drive I can replace my old drive with. Specifically, I need to know the size; is it 3.5" or 5.25"? I know that the new drive has to have parity disable, but I don't even know what it means.

I am a bit on defensive side here. Ready to take all the sneers that will probably come my way but I believe that if I am to learn something I've got to ask the questions.

Will someone please give me an in-depth explanation or direct me where I can look for that info myself?

I would really appreciate your effort.

Wojciech Galuszka (wojci_g@pavo.concordia.ca)

4032. Re: ST4766N and AdSCSI Plus ST

In a message on 27 Jul 93 the following was penned by Dana
Brigham....
DB> I just 'scraped' up a Seagate ST4766N SCSI hard drive, I think it
is
DB> about 650MB formatted. Should it work alright with an AdSCSI Plus
on
DB> an STe? Does someone know the paramters I will probably need to
DB> enter when formatting/partitioning it (hds, cyls, etc.)?
DB>
Well when I fitted one on my STFM the ADSCSI utilities (v6.05) recognised it
correctly and I was able to use it no trouble with the Advantage Plus Board
(old ADSCSI Plus).

DB> Also, I will probably use it on both my 1040STe (4MB RAM) and my
DB> old 1040STf, which have TOS 1.6 and 1.0 respectively. That means I
DB> should be using no larger than a 16MB boot partition, and the STf
DB> will only 'see' the partitions 16MB or smaller, right?
Yep so you will have to use either 16Mb partitions or go for BGM (Big Gem
Partitions) though these are slightly inefficient if you have many small files
on them!

DB> Oh, where can I grab the latest ICD utils - assuming I need them
for
DB> the AdSCSI Plus and this hard drive....?
No idea, sorry (I am new to this USENET lark).

4036. ST Replay 4.1 Troubles -- Please help

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-05 04:44:46 UTC
From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.744525886@cwis>
Source record: 37383

I am having a lot of trouble with my ST Replay Cartridge. I remember when I first got the cartridge from a friend along with some samples he had made the samples were very clear (even at 20KHz...) All of the samples I find at ftp sites are very clear too, even at lower speeds.

BUT, I have been trying to sample things myself (the sampler is the older ST Replay cartridge... with a rca port for audio in and a rca port for audio out.) I have the audio in of the cartridge hooked to the video out of my receiver (which sends a line level signal of my cd player when I have CD selected, tape when I have tape connected, etc.) Anyway, I make sure and adjust the level of the source (like a portable tape player) so that the monitor function doesn't clip any of the input sound.

I am also using gold plated RCA patch cords to hook everything up just in case that might have been the problem. It wasn't. Even when I sample stuff at 30KHz, silent portions of the sample are VERY noisy and the vocals are unclear and the music is really quiet. I took out the cartridge and cleaned the contacts of the cartridge itself... that didn't help either.

What else could be the problem? Could the cartridge just be broken or am I doing something wrong? Isn't 30KHz supposed to sound pretty clear?

Any help would be appreciated. Thanks!

warwick@cs.uq.oz.au (Warwick Allison) writes:

>don't understand how the palette comes into it: how can you convert
>a standard form bitmap into a TrueColour bitmap without also passing
>the palette???

you will have to determine the device dependent color representation and do your own color remapping on the standard data before calling vr_trnfm. You can get this information by blitting (vrt_cpyfm) single pixels in all available colors into a sample buffer. You will then have to convert this buffer into standard format and analyze its contents. BTW, the doc's in the Profibuch are not entirely clear on this topic. I could post some sample code, if you want it (Warwick: I think, I sent it to you some time ago; it was the portable Degas Picture Loader).

So long

Give up and update to the latest version. It's First Word Plus 3.15. I
have still to find a bug in it.

Now, I rather use Le Redacteur 4, which has a very good dictionary, a thesaurus,
a verb helper (it knows how to conjugate a verb), and is available in
English, French and German versions (including dictionaries). Expandable
dictionaries, planner, comes with a database, a worksheet, and a doodling utility, much
like Atari Works.

From: ekrimen@netcom.com
Message-ID: <ekrimenCBAx17.1JB@netcom.com>
Source record: 37297

Replacing the internal drive in a MegaSTE or TT is really easy.

1. Remove the cover of the hard drive bay. This is done by one screw under the computer.

2. Detach the power and SCSI cable from the drive. Oh, you'll probably also need to detach the drive activity (light) wire from the drive to the front of the case. (I'm doing this from memory.)

3. Remove the drive mech from the external hard drive bay housing. The drive should be mounted in there by four screws. There might also be a metal grating on the case, covering the bottom of the drive; this will have to be removed too, probably first.

4. This Seagate 157N drive can be replaced with any other SCSI drive conforming to the 3.5" form factor. Good drives include Quantums and Maxtors. I have a Quantum LPS105S in my TT now, and I had one in my MegaSTE. I think there are 1gig drives in the 3.5" size, so they will fit in there too.

Have fun.

the separate C and C++ compilers have disappeared when changing from
GCC 1.x to GCC 2.x
in the gcc doc, it says that running g++ is exactly like gcc except
for a few very little tiny detail. gcc compiles c++ files just fine !
(I guess the main difference is that g++ assumes every file is in c++
whereas gcc assumes a .c file is in C)
And yes, gcc also compiles ObjC. But I have no idea where the libs are

are there any docs?
what tape drives will work with it?
do they just plug into the back of my ICD scsi chain?

It is my understanding that the scsi tape cartridge drives for
the pc's (msdos) can be bought for ~$250US... I sure would like
to add this to my ST!

Please send e-mail. Thanks.

>My point exactly..... 8-) (Sorry!)

Hi Steve,

I'm in the same situation you are. I'm using a color monitor, so
Connect and Stalker don't suit my needs. So rather than berate you
for not having a Falcon or a mono monitor, I'll just suggest that you
use Freeze Dried Terminal.

There ARE some things about FDT that I don't like. For instance, the
emulation (ansi) is not very good. For some reason I cannot get it to
give me inverse text if I switch back and forth between menu/online.
For that reason I call up Uniterm when I'm reading text and need inverse.
It's a pain, but it works. This problem makes it very difficult to
use FDT with certain newsreaders.

Also, the text editor leaves a lot to be desired. I suggest you call up
a real word-processor for this too.

Of course, these solutions only work if you have plenty of memory. I
guess that's life though. I'm eagerly awating the new release of FDT
to see if these complaints are fixed. If there were not, I was just
going to buy Flast II. But since I can see by your posts that it's not
very good, I guess I'm out of luck.

Anyway, I hope this helps. Freeze Dried Terminal should be available
at any major FTP site. I can say that the author did a good job on
the program. There are some nice features, like autolearn auto-logon,
auto-Zmodem, etc. But there are bound to be things you won't like about
it. As far as terminal programs go, I consider it the best option if
you're using an ST or STe and don't have a monochrome monitor.

From: wojci_g@pavo.concordia.ca
Message-ID: <5AUG199320574025@pavo.concordia.ca>
Source record: 37303

I would like to thank all of you who helped me with information about replacing my Mega STe hard drive. USENET proved to be a great place to look for some answers and its users proved to be helpful!

| Ed Krimen |
---------------> You said that you have an LPS105S in your TT. Can you please tell me how many megs does it have, how fast it is and whether it has a cache? I called a computer store near where I live and they have a Quantum LPS240S hard drive, which is a 245 meg, 12 ms, 256k cache. They ask a hefty price - $520 Canadian dollars which would translate to about $650 US. Fortunately, I know of places that will charge me much less. The store in question proved helpful in providing me information about their stock though.

I also have another question. Can someone tell me what is the largest size of a partition that TOS 2.05 can support? Is the difference between GEM and BGM partitions very visible (in terms of access time)? I am interested in getting a hard drive that is between 200 and 500 megs.

Wojciech Galuszka (wojci_g@pavo.concordia.ca)

Yeah, get the LPS240S. It's the 240meg version of the LPS105S, which is 105megs. $650US is too much for the drive though. I've seen them in the $300-$400 range.

>I also have another question. Can someone tell me what is the largest size

TOS 2.05 can support very big partitions. GEM is limited to 32megs (512K sector sizes) I think, and BGM (BigGEM) are larger because they can use larger sector sizes (1024K, 2048K, etc). You really won't find a difference in the access time between the two, although theoretically one could say that you would.

Also, get ICD's SCSI Pro utilities. Definitely worth the $50. Don't even look at Atari's drivers and utilities.

4052. writing to cartridge port

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-06 03:30:17 UTC
From: bnell@scr.siemens.com
Message-ID: <CBBJ2H.8rM@scr.siemens.com>
Source record: 37305

Hello,
A couple people asked me to post my results on how to write to the
cartrige port. The easiest method is just using one of the address
bits (the highest or lowest bit are the most logical choices). So
whenever you do a read from the port space with this bit set, the cartridge
can check this and use the address you passed as the actual data.

There were a couple other methods which require some hacking up of your
computer. Basically you bring the r/w line out to the cartridge port.
But you also have to cut the lines that cause a bus error whenever you
try writing to the cartridge port (ROM3 and ROM4 if I remember correctly).
On top of cutting these lines you have to add a little hardware to them
so the MMU doesn't get confused. (I can't remember the exact details now).

Hope this helps...

Bill

To hook up an ST to an RGB monitor, my colleague has a cable which connects both HSYNC and VSYNC (9 & 12) to video input on a SCART socket. This is labelled as "synchronisation"

Could try it...

Since TOS 1.4 a GEM partition is limited to 32 Mb (instead of 16Mb before).

A BGM partition can handle far more.

I've used both GEM and BGM on the same Quantum LPS52S drive, with no sensible speed difference... The only difference is the place taken by th files (especially if you have many little files): since the number of clusters in a partition is limited, with a BGM partition you must increase the size of the cluster to inclrease the size of the partition.. The effect is that on a partition where a cluster takes 1 sector (1/2Kb) a 137 bytes file will take 512 bytes on the disk (plus name entry in the directory), and in a huge partition where clusters are 2Kb (8sectors), the same file will take 2Kb on the disk...
The only incidence of the cluster size is that with smaller cluster sizes files can be more fragmented, and average access time can decrease...
But what you want is to increase the cluster size, no ?
And if you have a 200 or 500 Megs disk, I think it doesn't matter if a little file takes 2 or 4 Kb... You may lose in the worst case ... say... 1 or 2 megs on the whole disk comparing to smaller cluster sizes ...
So, USE BGM, it's great...

But, of course, don't make only HUGE partitions on the disk ! (just in case of crash of a partition)

Ah : I think the 1st (boot) partition MUST be a gem partition, doesn't it ?

>on the whole disk comparing to smaller cluster sizes ...

No, in my experience the loss is greater. I had my 210 MB harddisk
formatted with one big partition, cluster size was 8k. Adding used and
free space I got only about 120 MB ... so I lost 90 MB due to big
cluster size.

I then wrote a small program to determine the loss depending on
cluster size. As far as I remember, the ratios were approximately:

cluster size file length / used space
0.5k 95 %
1k 90 %
2k 80 %
4k 67 %
8k 50 %

Of course, with large binaries the ratio is better, with smaller files (e.g. .tfm-files for TeX), it may be even worse.

In fact, I gave these numbers just guessing... I didn't think it was so
amazing!!! 50 % is awful !!! What sort of stuff you have on this disk (text,
binaries ?) just to have an idea of the way you fill it (or avg size of the
files, if you know it)?

That demonstrates the use (another use, in fact) of having several partitions
instead of just one big !

a.a.u.e (well actually all of archive.umich.edu) does have a pretty strict limit. They allow only 10 ftpers during the day, which goes to 20 after about 5 and 30 after 11pm. 60 on weekends. Even so, this is VERY limited.

wuarchive.wustl.edu allows * 250 * users to ftp in. Admittedly they are probably a larger archive area as they have more disk space. They do have everything on a.r.u.e (one day delay usually). So that is a better place to ftp to. (umich is faster, but the chances of getting on are fairly bad).

a.a.u.e does have AFS though. So if anyone actaully has AFS they can set up a link to the archives and access the files with normal unix operations (i.e. cp)

Fine for Heat'n Serve C Users - BUT A lot of us still use Mark
Williams C. So I implemented the above in the following assembler code

**************** file chk_gdos.s ********************************

/ function to test whether GDOS is loaded
/ It returns zero if GDOS is not loaded, otherwise something else

.shri

.globl chk_gdos_
chk_gdos_:
link a6, $0
moveq $-2,d0
trap $0x2
addq $2,d0
unlk a6
rts

*************************************************************************

Compile the above with "as" (Mark Williams' Assembler) i.e.
```

```
as -gxl -o chk_gdos.o chk_gdos.s

and you will get a file, chk_gdos.o ( 84 bytes long in my case), which
you can to your libc.a library (or some other library you use) using the
archiver "ar".

Thereafter in any future program you can test for GDOS simply
with

if (chk_gdos()) { GDOS is present..... }
else { GDOS is not present }

I've only just implemented this & on minimal experience it seems
to work.

Cheers,
W. Alan B. Evans

There is currently work going on to port Linnux to the 680x0 family.
Unfortunately most of this is being centred on Amigas at the momment.
From what I've been picking up of the mailing list I would say a full
working version on Amiga is about 2 months away. The Atari port will
probably be a couple of months after that.

Another alternative is NetBSD. I don't know so much about this, but
there is a porting effort going on for Amiga. This might well get
finished quicker since NetBSD isn't tied up with Intel architecture
like Linnux.

Actually, I use STalker all the time on color monitor, without GDOS fonts, and without resorting to the 8x8 system font. Since you can turn off the title and scroll bars on STalker's window, you can get an 80x23 screen. Admittedly this isn't the standard 80x24, but most of the time it's close enough. You can still resize the window, and you can still scroll the window's contents. (The former by using the mouse, and the latter with the keyboard.) And, of course, if you really feel you need a bigger screen, you could use GDOS fonts or the smaller point size.

I certainly have to agree with the comments of some of the others that the advent of Geneva, MultiTOS, etc. makes running in a GEM window a much more important feature.

My apologies. I used the conversion factor the wrong way. $520 Canadian does not translate into $650 US but rather into $420-$430 , depending on the standing of canadian dollar.

Woj.

>There is currently work going on to port Linnux to the 680x0 family.

>Another alternative is NetBSD. I don't know so much about this, but

But these two packages will not run on the older 68000 based systems since these
cannot support virtual memory.

I guess it'll be hard to port them to 68030-accelerated STs since
it is not documented what kind of dirty mmy
manipulations one or the other board manufacturers might have implemented :-)

>It's a pain, but it works. This problem makes it very difficult to
>use FDT with certain newsreaders.

I think the problem is that FDT uses IBM-ANSI, which is not the same
as VT100, which in turn is what UniTerm uses. I have never seen a
Unix-site that supports ANSI. I think it is quite common to think that
VT100=ANSI, but that is not the case. My personal experiences with
FDT's ANSI-emulation are very good, it has the fastest emulation I
have ever seen on any terminal program.

>Also, the text editor leaves a lot to be desired. I suggest you call up
>a real word-processor for this too.

That's true, but then again FDT is a terminal program, not a
word-processor. The export function of the scrollback buffer that
exports text to the editor is so slow, that it takes seconds to export
just 20 lines to the editor.

>"Skunk32" 398,- DM (US$235), 32 MHz 68030

>(but it sounds like they use the old _16_ MHz 68030 for this purpose...)

Well, I'm not too convinced of this one, either.
It indeed uses the old 030 for that purpose.
And, when we tried one of them, it did not work at all (our Falcon030
did not boot anymore). So it seems that this "accelerator" is not yet
fully recommendable.

Furthermore, what I saw of the "Skunk" was a hardware that wasn't worth
more than 5 DM, including the disk shipping with it. I don't know how they
justify their extremely high price, but the board I saw consisted mainly of
one chip, looking like a simple GAL.

I mean, it's their business how they calculate their prices, and I'm not
sure if what I saw was the advertised, final version.

But if the price you mentioned (about 400 DM) is really true, I can't see
why ayone should pay about 100 times more that the chip's really worth.

My personal opinion is that this Skunk smells like a giant fraud.

Sorry to disappoint you Roger, but Michael is using Heat & Serve C,
which does support inline assembler.

It's also got a real good vq_gdos() call in GEMFast (I should know, I
wrote it! :-)... The long it returns can hold special meaning depending
on the type of GDOS you're using. For example, FSM-GDOS returns "_FSM"
as the code (0x5f46534d in hex). I haven't fiddled with it recently to
see what NVDI or SpeedoGDOS return.

Source record: 37331

As far as I know, all versions of MiNT that read the mint.cnf file have a bug in the way they handle the setenv command for setting environment variables...

If you use:

setenv BLAH=one two three

$BLAH will be set to "one", without the quotes.

If you use:

setenv BLAH="one two three"

$BLAH will be set to "one two three", with the quotes.

This is annoying, and I guess it only affects my; I set $POVRAYOPT to have defaults for POV-Ray, a great ray tracer that runs nice in the background, even on my ST. I reported this bug to Eric Smith on GEnie over a year ago, but I guess he forgot about it.

Here is a patch for MiNT 1.04 that fixes the bug, which is in main.c. Use at your own risk, but it's not a major change, and it appears to work quite fine.

This fix lets you use:

setenv BLAH=one two three

but not:

setenv BLAH="one two three"

to set $BLAH to "one two three", without the quotes.

Why don't you use ftell()'s stdio companion fseek(file, offset, base)?

I don't know about MWC, but I remember using Lattice C (a, long, long time ago:-) and that compiler did all kinds of weird things with stdio in text mode. And, stdio's fileno() did NOT return a gemdos handle (there was some translation table in-between, if I recall correctly...). So I don't think mixing stdio- and Gemdos calls is a good idea.

Hope this helps.

4084. C/MiNT Help ... and other qustions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-08 17:36:27 UTC
From: asmodeus@telerama.pgh.pa.us
Message-ID: <243dir$68r@telerama.pgh.pa.us>
Source record: 37336

WARNING: Long post with lots of stupid NEWBIE questions to mint/gcc

I have installed MiNT .95 with the instalation disks, and most of the utilities as well. I am using the login program so that I have to login to the systen, using root or the name that I chose to use in istalling it.

I have tried to use lpr to print things, or the other command that escapes me at the moment tha tis very similar to lpr, and I get an error about the lpd or lpr, or something like that. SO far, I have just used this to print files:
cp foo.bar /dev/prn (or something like that)

It works, but would rather have the print manager spool it out for me.

So far, I have only seen MiNT version above .95 as sources, is there an advantage of compiling these version on your personaly machine over grabbing the binaries? Same question about minixfs, still using the version that came with the installation disks, is there a new version? and if so, what are the advantages?

Speaking of minixfs: As it is now, I have turned off the ICD caches, because of problems that I was getting within the system, init, or something, and the problem has gone away. Is there a cache that works with both ICD host adapter and MiNT/minixfs? Or am I just not setting things up right.

I have this in my MINT.CNF file:
setenv UNIXMODE /cub
But I still can not make a file that uses CAPS as part of the filename while in the shell. Some of the archivers that I have will create a file occasionally that will have some caps in them, but I can not make them that way. The only docs that I have for unixmode is very old, and was from a local PD disk from a users group. Dated around '90 or so.

SOrry about all these questions, but I am very new to this, and reading the docs that i have been able to find are not much help, well, back to the questions.

When using GCC, is there a predefined sysvar for the atari computer that I can use with #ifdefined commands? ANy other special sysenv's that I should know of? Any way of seeing/getting a list of all the variables that are known in my system? With or without the values>?

The last question, and there is a cheer from the crowds, or as they say in MT-THG ("...and there was much rejoicing. YAY!!!!")

Is there a way or an advantage to using warp9 with mint and init? I am not really booting gem, that I know of, and have the u:/dev/fasttext thing on in the config, but would really like the speed of warp9, but I have assumed, wrongly probably, that warp9 does not like not being able to find gem.

In general, I need one hell of a tutorial on this subject. If anyone knows of additionaly docs, FAQ's or such, please let me know where I can get them from.

Thanks in advance...

4085. How Do I make GCC compile C++ code?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-09 00:32:53 UTC
From: cmedley@wam.umd.edu
Message-ID: <2445vl$t0t@cville-srv.wam.umd.edu>
Source record: 37339
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm trying to get my installation of GCC to recognize and compile C++ code, and it very nearly does it except that I believe it is relying on an internal rule to run a program called:

cc1plus

instead of gcc-cc1+.ttp when it is required. I vagurely remember a separate environment variable was required to over-ride this rule. Can anyone shed some light on this?

(right now, i can still use g++.ttp and get the correct results, but if gcc.ttp can do it, then i figure I'll save myself a little extra trouble when I run into makefiles that need converting...)

Thanks in advance to any help anyone offers.

Nope! This isn't true. Old St's had this problem.

As far as I know, this is a "feature" (read: bug) of TOS 1.02 machines, which
(unfortunately) is the machine I've got. I would suggest getting hold of a
program called FMC (Force Media Change) which should remedy this problem. It's
what I'm using. You can get it at a.a.u.e in the Diskutils directory. The file
is called fmc.arc and is around 2K in size. Then again you could also think
about upgrading your TOS, which should also clear the situation, albeit at
greater monetary cost to yourself. Be clever, take the cheap way! :)

Any and ALL flames go into /dev/null

Hope this helps...
Barry

I've got the same problem two month ago, with my old 1040 STF (just 1 internal
2sides drive). I discovered after a while that a DISQUETTE was responsible of
this (how ? didn't ever know) :
I could use my computer as long as I wanted, with many different disks, no
problem...
Then I read this disquette, and then no way updating the disrectory, either by
pressing ESC, or closing and opening the window, or whatever...
Just reading the directory of this disquette...
It cannot be attributable to random, since I repeated the experience MANY times
before being sure it was the real cause and formatting this disquette again...

A virus checking using Sagrotan and VKILLER was negative, and the directory was
read normally (not 4745587571125444888568 bytes used by 4567fgbhkldfhjjd items:)

I never had such a problem then, and I never knew the cause... If someone has an
idea, let me know.... Forward here or e-mail...

The mono and colour cables that you are indeed different. This is
because the mono and colour monitors use a couple of different lines
and in order to save money the ones not used are not included. The
wires just arent there... The pins are the same, though, so its quite
possible to make your own cable, so long as you can find at least a
9-conductor lead... But watch out when you take the connectors
apart... They have a tendency to violently explode! No kidding! I
lost the connector from my SC1224 that way. It was broken beyond
repair, so I had to kludge a connector with DB25s and the connector
from my SM124... Look at the pinout in the back of your ST owner's
manual and you'll see the differences...

4090. how much power can my 1040STf supply?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-09 11:21:22 UTC
From: lancer@rajeesh.WPI.EDU
Message-ID: <LANCER.93Aug9112122@rajeesh.WPI.EDU>
Source record: 37268

I have a 1040STf with an internal, stock power supply. It's an early model (1986ish) if that matters...

Anyway, I'm upgrading the thing and I got to wondering... Am I overloading this thing's power supply?

I've got an Xtra RAM board in it with 4 1meg SIMMs, a fan, a Magic Sac+, and TOS 1.4 ROMs. I don't think the ROMs make a difference, but hey, who knows? *grin*

Anyway, is this too much to draw off the supply? How much are those internal supplies good for anyway? I suppose I should check and see how much the fan draws (not too much... it's small and VERY low power...). I'm more worried about the memory... The old RAM is still in it, and I expect it's still drawing power too. Should I disconnect the big resistor that feeds those chips?

Should I just give up and stick the thing in a tower case? I've been meaning to do that anyway... So what size case should I look for? The motherboard is pretty big... 18 or 19 inches... Would a full tower PC case have enough room for it? And what do I do for a keyboard then? Should I get the DEKA IBM keyboard thing?

Thanks,
.s.

If I understand correctly what you want to do, you do not really need a
fullblown Unix for your needs. If you use Mint and the Minix FS along
with a unix shell you could write scripts that would run on the unix
boxes at work without a problem and vice versa. A lot of other unix
tools are available for this environment too. If that is all you need,
that is probably the best and cheapest and most reliable solution.
These programs are available on most ftp-archives and most PD firms
also sell these.

>Why don't you use ftell()'s stdio companion fseek(file, offset, base)?
>
Thanks for all the help! I had originally tried fseek as described above,
but because the first call was fseek(fin,0,0) (forgot the cast to long :-|
on the second parameter, the first 0) I got a spectacular bomb. Since I
am also not getting any flags from the linker when functions't exist
(WHY??? Don't have a clue ....) I thought that meant that fseek() didn't
exist. EGREPping for ?seek yeilded an obtuse #define Fseek(a,b,c) and
no fseek() in the .H files. Turns out that MWC chose not to include
prototypes in their .H files for the functions which return int. Yea, it
is pre-ANSI ok to do this, but I never got into that habit :).

fseek() *does* exist, and works properly when you cast numbers properly ....

The problem I was having was due to mixing BIOS handle calls with MWC FILE*
calls. I suspect that the two don't communicate everything that takes
place with each other....

I also found my lexicon. (Asked my wife, and 15 minutes later :-)

Thanks again for all responses!

4095. Is all SCSI the same??

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-09 18:10:57 UTC
From: paul@charlie.ame.arizona.edu
Message-ID: <1993Aug9.111057.4708@arizona.edu>
Source record: 37250

Simple (or not) question: do all SCSI hard drives work the same? In particular, I've acquired an old (~1987) 71 MB Sun hard drive, which I've been trying to get to work with my TT. The problem is that externally it has 2 DB-50 SCSI connectors (they say SCSI), which is nearly impossible to connect to anything else. But internally, it has a "standard"(?) 2x25 (I don't know what it's called) which is the same as is on my internal drive. So I hooked up this connector to a Centronics-50, which I connected with a standard cable to my TT. I know the cable works, as I took my internal drive and connected it with it and it worked fine. But I get no response from the Sun drive. It seems to warm up fine, and I had my other drive disconnected. But any formatting or other HD program (eg, 'RATEHD') either says it's not there or locks up when scanning.

So, is the internal SCSI connector the same? Another possibility is that the old drive requires a terminator, while my newer one may not need it (or has it built in?). Any suggestions?

-thanks.

4096. How do I program for Navarone Video digitizer?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-09 19:29:12 UTC
From: wilsont@rahul.net
Message-ID: <CBIBGo.LtM@rahul.net>
Source record: 37248

I dug out my old navarone video digitizer, and the software that
came with it is useless for my purposes.

I began by dumping $fffa0000-$fffc0000 into lower memory, and looking
at it in various resolutions. No luck there, but it did show a pattern.
A 64k block starting at $fffa0000 always changed, a sample looked like:

ff 3e ff 7e ff fe

0xff was in every other byte for the whole length of the block.

3e, 7e and fe were common.

I tried putting a white square in the middle of a black field, and
there wasn't an area of high contrast in the data.
(say, a bunch of ff's or a bunch of 0's for a scanline of the square)

Heck, all black didn't reveal much, only that the whole block was filled
in. (3e's, 7e's and ff's!)

Any hints? should I stack the lines? only read lowbytes of the words?

Any digitizer theory?

thanks!

The cable you need is a SCSI cable for an original MAC. One of those connectors
on the drive you connect to the MAC cable, the other should have a terminating
resistor. If you have the manual on the drive make sure parity is disabled.

Other than that I can not help.

Source record: 37255
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

There is heaps of confusion over all this GCC/G++/Objective stuff.

Here are the facts as I see them:

1. The *compiler driver*, called "gcc.ttp", recognises both
".c" and ".cc" extensions (among others), and passes
them to the appropriate *compiler* - either "gcc-cc1.ttp"
for ".c" files, or "gcc.cc1plus.ttp" [usually truncated
to "gcc-cc1p.ttp"] (actually, it passes them through the
preprocessor (cpp.ttp? gcc-cpp.ttp?) first).

2. If you are ONLY compiling .cc (C++) files, you do NOT need
the C compiler (gcc-cc1.ttp). But you need both the
compiler driver (gcc.ttp) and the C++ compiler (gcc-cc1p.ttp).

3. Regardless of what you are compiling, you need:

- The linker (gcc-ld.ttp) to link .o files to make a program.
- The assembler (gcc-as.ttp), since the compilers produce
Assembler code which they both pass through this.
- The C library (gnu.olb).
- The runtime code (crt0.o).

4. If using any libg++ libraries (eg. iostream.h), you also need
the c++ library (g++.olb).

5. In previous versions, there was a separate "g++.ttp" compiler
driver which understood ".cc", but not ".c", while "gcc.ttp"
understood ".c" but not ".cc". All that has happened is they
have combined them into one.

6. There is a Bourne shell script called "g++" that is distributed
with the code from FSF which does some minor things to make
"gcc.ttp" seem more like the old "g++.ttp" (for example,
it adds the "-lg++" automatically. I haven't used it -
it isn't worth the effort (and how does it know where
to put C and C++ libraries???)*.

7. The compiler driver (gcc.ttp) also recognizes ObjectiveC files
(".m" files), which it passes to the Objective C compiler
("gcc-cc1o.ttp"(?)). This also requires the Objective C
runtime code, which was included in at least one of the
"gcc2??bc.zoo" files ("a" is generally the C and shared
stuff, "b" is generally the C++ compiler, and "c" is the
ObjC compiler).

With all these requirements, you may as well get the C compiler (600K
or so compressed) along with all the other stuff.

* C/C++ libraries should be linked like this:

gcc {file.o} {-lC++Library} {-lg++} {-lCLibrary}

(although often it makes no difference)

Okay, try this. Load a 100k text file into the text editor. Block off a
good portion of it with block markers (text should turn red.) Delete
the block. Now go eat dinner. Because by the time you're finished
eating it may be done with the operation.

Okay, I'm exaggerating. But it's AMAZINGLY slow. Apparently it's
doing a line-by-line deletion. It shouldn't do that. Or he should
at least write a faster routine. Jeeze man, it's fucking slow!

On 6 Aug 93 the following was opinioned by a young Ab Wilson......
AW> There is currently work going on to port Linnux to the 680x0
AW> family. Unfortunately most of this is being centred on Amigas at
the
AW> momment. From what I've been picking up of the mailing list I
would
AW> say a full working version on Amiga is about 2 months away. The
Atari
AW> port will probably be a couple of months after that.
AW>
AW> Another alternative is NetBSD. I don't know so much about this,
but
AW> there is a porting effort going on for Amiga. This might well
get
AW> finished quicker since NetBSD isn't tied up with Intel
architecture
AW> like Linnux.
Ok thanks for the help, shame that items such as this are no longer being
ported on the ST first like they did in days gone by.

I might just try some other suggestions first though (ie. Minix) but it
depends
on just Unix it really is.

>I have written an accessory in LaserC, and I was once told that I needed
>to declare the function strtol() at the start of a program that used it
>because it returns a long. Is it really necessary to declare it?

In ansi C you should not. Just include <stdlib.h>, and you get the proper
definition. But many pre-ansi compilers do not supply <stdlib.h>, so
you should declare the functions yourself. (Or put them in a stdlib.h
file, and include that.)

If you do not declare it, than the compiler will think the function
returns an int. This means that you will get the result in int precision,
and not in long precision. If you use strtol to get a long return value,
you have to declare it as long. If you use it because of its 'base' and
'ptr' arguments, which atoi() lacks, than you might also not declare, and
still have a working application. For really portable you should include
<stdlib.h>

I am bored with my Sun 3/50. I want colour graphics, sound and fun at (comparatively) low cost. So Falcon 030 here I come.

The questions I have are (and any help in sorting them out would be appreciated)

1. Will my scsi hard drive and tape unit work with the Falcon 030?

2. Does MiNt run on the Falcon 030. If so where can I get it?

3. I hear minix does not like scsi drives on atari machines. Well, I am happy to write a driver for it, but if I go for minix will it work from floppy?

4. Which is faster minix or MiNt?

5. How much disc space do they take up. I ask as I only have 140MB available.

Thanks in advance.

Xavier

Does anybody know a smart way to get a (MINIWIN) console window to start automatically in MultiTOS? If you try to do this from GEM.CNF there is the problem that MINIWIN expects the name of the application to launch in ARGV[0] so a `run' command wouldn't work.

I.e.

run c:\mint\miniwin.app c:\bin\console.tos

doesn't work-- you get an alert saying `No arguments to MINIWIN!'

Of course I could write a small C program that does some patching, but I thought there may be an easier way. Actually I think Miniwin should recognize when it is called without the ARGV[0] hack and read the first argument instead. Eric?

Hi,

Not to worry, I will keep in touch. Just got word version 3.72 of UUCICO is
out; don't know where to find it though.. (ANYBODY??). I received at least
eight mails concerning this problem; with the current UUCICO versions you
simply can't define more than three fields in HOSTS. We'll just have to
wait, I guess.

sigh

Help!

I got AIM 3.1 beta some time ago and i'm going to like it.
But there is one nasty bug in the HPLJII printer driver:
Every second line is indented by about 1.2 mm (0.1 in) (32 dots ??),
which looks really ugly in small magnification and quiete bad
in larger.

Since i have changed some of the ESC-Codes in HPLJII.PRT i don't
think it's the wrong code send to the printer, but rather an error
in the copy loop, which skips one longwort every second line.

BTW, i'm using a deskjet500, i can't test the driver on a proper LJ.

According to what i've seen, AIM will be one of the best programs
to print a truecolor image on a LJ / DJ.

(Of course AIM crashes some times and it doesn't like MiNT very well,
but it's still a beta version, isn't it)

Wow! I thought Sun's are quite good machines. (I'm typing on one now.)

>1. Will my scsi hard drive and tape unit work with the Falcon 030?

If it's a "standard" (whatever that may mean) SCSI HD it should work.

>2. Does MiNt run on the Falcon 030. If so where can I get it?

You get the newest version free if you buy a Falcon with a built-in HD.
Otherwise, any PD-library can probably supply you with it. (But then you'll
get the shareware version.) You can also buy Multitos for (I think) $60,-
wherein MiNT will be included.

>5. How much disc space do they take up. I ask as I only have 140MB available.

Welcome to the world of Atari where programmers still now how to program
efficiently and don't make programs of 10 HD-disks. I'd say 10 Mb will be more
than enough, so don't worry.

Greetings, Tim

|> 1. Will my scsi hard drive and tape unit work with the Falcon 030?

Yes, either Atari's HDX or ICDs software will take care of you HD, make sure
you can disable parity.

To my knowledge, tape software is not currently available for the Falcon, I hope
someone can prove me wrong.

|>
|> 2. Does MiNt run on the Falcon 030. If so where can I get it?

Yes, it runs MiNT/Multi-TOS and it comes with any Falcon that comes with the
internal hard drive (80 meg) :)

|> 3. I hear minix does not like scsi drives on atari machines. Well, I am

Use the Minix file system for MiNT, available on better Atari FTP sites near
you :)

|>
|> 4. Which is faster minix or MiNt?

Good question, Has any one tried Minix on the Falcon?

|>
|> 5. How much disc space do they take up. I ask as I only have 140MB available.

MiNT/Multi-Tos use about 100k including Minixfs. The full set of utilities, and
shells, including GNU C/C++ with libraries take up another 10->15 meg depending
upon what you want.

The last I heard was that the MINIX-ST guru doesn't have a Falcon
so he can't do anything. And by the way, I think minix(-st) is near to
death (except ofcourse at our University, AST wil make sure of that :-)
Anyway, perhaps there will be a Linux for the Falcon/TT in 6 Months....
Hopefully the Linux68k developers keep us posted.

>this really so & if so what signals are present/not-present in each version?
>This is the first time in 5 years that such I ever heard sucha thing...

I could be wrong, but here is what I have heard/observed:

Since the color monitor is an RGB, it has lines not used in the MONO
cable. However, these lines do not conflict with the mono lines, so a
"full" cable could be used for both signals.
`
The dirrerence that matters is apin that tells the ST if it is a
color or mono monitor. If you have an external switch you will see that
the ST reboots when the monitors are switched. You have to know which
line that is so that you can tell the ST which monitor you have.
Presumeably you ground the signal to tell the St one thing, and give it
+12 (maybe +5, but 12 seems more likely for monitor) for the other
mode.

4119. GEM + VDI scroll window?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-10 22:55:34 UTC
From: whitbeck@equinox.unr.edu
Message-ID: <1993Aug10.225534.16387@unlv.edu>
Source record: 37273

I am writing a small GEM application to do
multivariate analysis. I want to put the results in
2+ windows with at least one of them scrollable.

I know that I can use graf_handle to use VDI
routines and wind_creat() to create a window
h = graf_handle(...)
w = wind_creat/open etc.
v_gtext(...)

and the text, line, whatever , appears in the
window. BUT how did it know to do that? What
happens if I have 2 windows???? Which window gets
written???????????

(I am using Mark Williams C and also have Megamax
for what it is worth)

I would appreciate any help or examples!

Many thanks in advance.

4120. How do I Port GCC (mainly, Objective-C) to ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-10 22:58:51 UTC
From: cmedley@wam.umd.edu
Message-ID: <24997b$6p9@cville-srv.wam.umd.edu>
Source record: 37272
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.lang.objective-c

I'm trying to learn Objective-C, but since there doesn't seem to be a version of gcc-cc1o.ttp floating around, I wanted to try to compile it myself from the latest sources. The problem is, I've now got a 19MB .tar file sitting on my account here at school, and I have no idea how to get this ULTRIX box to build a cross compiler for the Atari ST (the distribution doesn't include a configuration for the Atari ST in its m68k directory) in order to make the compilers for the Atari.

If anyone out there could give me some pointers on how to do this (or just get started) I'd be eternally grateful....

(I'm tempted to bring all the source required for Objective-C down to my current GNU C on the ST and try to compile it on here... but even so, I'm not sure that would guarantee success...)

If you have MINIWIN.APP set up properly in your GEM.CNF to launch TOS
programs, then simply install your application (CONSOLE.TOS) as boot-type
'AUTO' from the desktop, and save your desktop. This works great;
unfortunately, however, the desktop only allows you to install ONE and
only one program as a boot program -- even with MultiTOS running -- all
others must be placed in the auto folder in order to get around using
the 'run' command (which I've never seen work).

] Like I said, when I switch between my online screen and the menu I
] lose inverse video. I have to exit and run the program again. It's
] a pain in the butt. And it's NOT full-color ANSI it's four-color ANSI.
] I don't care about blinking text.

Try making ST-Medium show 16-colours with an 80*25 screen, and enabling
the screen to keep up with 9600bps! ANSI-Term is *THE Only* ANSI
emulation program that lets ST's show 16-color ANSI! (e.g. the STFM
you would have purchased, not with graphics cards etc.) Apparently
some folks have gotten 16-col's out of it on TT's etc. (Anyone!?)

] >Well, it's got a better 'text editor' than any other comm's package I've
] >seen - all the others just have an editable capture! (with minor
] >exceptions!)
]
] Okay, try this. Load a 100k text file into the text editor. Block off a
] good portion of it with block markers (text should turn red.) Delete
] the block. Now go eat dinner. Because by the time you're finished
] eating it may be done with the operation.

It's a comm's program, not a word-processor! Besides, in GFA basic,
there aren't many easy ways of doing this without resorting to means
which would probably screw up something else (In-line assembly may be
okay, wait until v3 - that should be at least First-Word+ speed)

] Yeah, it's a nice package. But I find it annoying to have to exit
] it all the time or call other programs externally. Maybe I'll have
] to buy another computer if I want a decent terminal program.

Try Telemate 4.10 on the PC.

>2+ windows with at least one of them scrollable.

>h = graf_handle(...)
>w = wind_creat/open etc.
>v_gtext(...)

Uh, no, you still need:

v_opnvwk()
wind_get()
wind_set()
you'l also need an evnt_multi.. etc etc.

Books have been written on this.

>and the text, line, whatever , appears in the
>window. BUT how did it know to do that? What
>happens if I have 2 windows???? Which window gets
>written???????????
v_gtext(int vhandle,int x , int y, char *text);

right there... at whatever x,y coords you stick in it.

its a matter of using wind_get() to grab the work area of a window,
setting the clipping, and v_gtexting your text into the window.
Then there is the window events (arrows, closing etc) to deal with
and the damage rectangles... etc...

Get C-manship complete, Clayton goes over all of this beautifully.
its a very big topic.

I haven't found a way to do this in LaserC, if someone else knows how to
do this I would appreciate some info.

In response to your question, the accessory automatically saves the
current file in FirstWord Plus. You tell the accessory how often you want
the document saved, and it will handle the rest!

4127. Sozobon C, 1.33i, Gulam

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-11 07:57:59 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.03qu@terapin.com>
Source record: 37281

Hi everyone. I'd like some help with Sozobon C. I have version 1.33i, and have read all the docs, etc. I'm trying to use it with Gulam, and have set the evnironemnt variables in my gulam.g using setenv. It says in the docs to just type make in the examples dir. This doesn't work, or make sence since there is no make in examples. There is only the .mak and I don't think the cli will automatically run the make.ttp in the bin dir.

What am I doing wrong, how do I solve it? Also in the environment variables, I can use a comma to seperate the path in the first line of according to the docs right? And I don't need a trailing backslash? I'm new to programming and would appreciate help to get my started. Yes, another ATARI programmer comming up.

Also, I decided to use Gulam because it would be easier to handle the files. It does work in GEM mode when I install it in GEM mode.. Although it is quite difficult because you have to go in and out of directories, use some kind of editor, even as an ACC, alot of command line typing and no macros.. Gulam seems alot easier with the history, and macros.

Well for those who do use GEM, what is your setup? I would figure Mint or Multi-tos would be ideal, but I only have an ATARI 1040 STE, 1 meg of ram, HD.

thanks,

afonseca@terapin.com

4128. Upgrades, Mega STe's and compatibility

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-11 08:10:08 UTC
From: mkite@lincoln.gpsemi.com
Message-ID: <CBL5Cw.Kqq@bailgate.gpsemi.com>
Source record: 37280

Hi,

I was thinking about upgrading my STe (1 Mbyte) by adding more memory (2 - 4 M) and maybe TOS 2.06 and maybe even an ICD ADSpeed board. Anyone got anything to say about these "ideas" ?! (Like where to get 1Mb simms for a reasonable price at the moment ...)

Then again - can you still get hold of Mega STe's anywhere ? 'cos that way I'd get a decent keyboard as well (Don't want a monitor or HD 'cos I got them already). And if I did that - how much software compatibility would I loose ?

I guess some of these questions have been asked before but I wasn't looking for the answers then ! Answers by e-mail please to save on repeated information on the net - I'll summarize here and/or directly by e-mail if anyone's interested.

Thanks,

Martin

Why don't you try TOSWIN 1.4.
You can start that by 'run' as TOSWIN.PRG too and in the TOSWIN.CNF you
define the Window with the console.tos to autostart. BUT don't try this
with the ACC of TOSWIN, because that will take 1.4 MB of RAM -
don't ask me why ??? The PRG takes something above 100kB!

I'm sorry to say so, but you re-invented the wheel -- such a beasty already
exists. I have an ACC here, called AUTOSAVE, that does exactly the same.
Only 3392 bytes.

Not much, since you can always revert to 8mHz with no-cache for compatability.
I would get the HD with the MegaSTe, better yet get a Falcon or TT with HD.
I originally did not get a hard drive with my TT. But I soon ordered one
so now both my systems have hard drives, and the TT takes up a lot less
desk space.

4135. 1.4 Meg Drives

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-11 13:24:07 UTC
From: ptucker@elli.une.edu.au
Message-ID: <928@elli.une.edu.au>
Source record: 37290

Has anybody had experience fitting a 1.4 meg drive into a 1040 stfm
We have two st in which the drives have gone bad and I seem to remember
someone posting that they had fitted a 1.4 meg drive though it only
formatted to 720k but worked ok.
The situation is we can buy 1.4 drives for A$90. A 720k sells for A$240.
Seem to remember that the writer said the plug needed inverting.
Have looked but cannot locate original posting. Is it possible?
Any advice would be very much appreciated. Post or E-Mail either OK.
Thanks

Peter Tucker
ptucker@elli.une.edu.au

4136. Canon BJ-200 Printer Drivers

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-11 14:04:17 UTC
From: dunham@src.honeywell.com
Message-ID: <1993Aug11.140417.8128@src.honeywell.com>
Source record: 37289

I recently purchased a Canon BJ-200 Bubble Jet printer for my Atari STE.
It can run in two emulation modes:

Canon BJ-10 Mode:

Canon BJ-200 (IBM Proprinter X24E)
Canon BJ-10e/BJ10ex/BJ-20 (X24E)
IBM Proprinter X24E/XL24
IBM Proprinter X24/XL24E
Canon BJ-130e
IBM Proprinter

Epson LQ Mode:

Canon BJ-200 (LQ)
Canon BJ-20 (LQ)
Canon BJ-10e/BJ-10ex (LQ)
Epson LQ-510
Epson LQ-850
Epson LQ-500
Epson LQ printer

Despite this range of printing options, I wonder if a specific BJ-200 printer
driver has been written for a) Degas Elite, and
b) a "Desktop" replacement driver.

The problem I have with Degas using the EPSON.PRT driver is, it prints a big
picture across two pages. And doing an ALT-HELP print screen of, say, the
Desktop, produces a picture that is less than the whole screen. So I found
a handy-dandy desktop printer driver replacement AUTO folder program that
allows you to use a DEGAS.PRT driver to replace the built-in driver. But
I still don't have a BJ-200 specific driver. I tried to write one using
Tom Hudson's Degas Printer Driver creator program, but I've had no luck yet.

Are there any "wizards" out there that have made some Canon BJ-200 driver's
for DEGAS yet?

Cheers, Scott

How much stack is being allocated? There is a stack size global in Laser C you can change, although usually you're increasing it, not decreasing it :-) . I don't have my st at the moment so I can't tell you the specific name.

There is already a program that does this. If you send a message to Paul Tuinman (I don't know is Internet-adres by heart, but you can find that out by reading one of his messages) he's probably got it. I mention him because the program's originally made by some Dutch guy (Peter Bloemendaal) and I've seen it on some BBS's in The Netherlands (where I live, but I'm on holliday in the US right now).

Greetings, Tim

The ST at home as got a 1.44Mb drive in it. Because we didn't update the Ajax chip it only does 720Kb. I don't remember any problems except for needing to cut a different hole in the ST-case.

Greetings, Tim

>happens if I have 2 windows???? Which window gets
>written???????????

If the text appeared in the window, you were lucky. VDI doesn't know about windows. What you should do is open a "virtual workstation" for each window, and use the virtual workstation associated with each window for drawing. But this only scratches the surface. You should try to get a GEM programming book to help you through this (e.g., C-manship Complete). Drawing in a window -- even drawing text -- is very complicated.

Good luck,

The easy way is to say

run c:\bin\console.tos

instead of

run c:\bin\miniwin.app c:\bin\console.tos

If you put this after the TOSRUN= line in GEM.CNF, then GEM will know
how to start the .TOS or .TTP program.

(Incidentally, MINIWIN looks in ARGV[1] for the file to run, not
ARGV[0]. Probably there's an error in the parsing code for GEM.CNF
that causes it to not correctly pass arguments.)

|me|: what signals are present/not-present in each version? This
|me|: is the first time in 5 years that such I ever heard sucha
|me|: thing...
|foskett|
|foskett|The mono and colour cables that you are indeed different. This is
|foskett|because the mono and colour monitors use a couple of different lines
|foskett|and in order to save money the ones not used are not included. The
|foskett|wires just arent there... The pins are the same, though, so its quite
|foskett|possible to make your own cable, so long as you can find at least a
|foskett|9-conductor lead... But watch out when you take the connectors
|foskett|apart... They have a tendency to violently explode! No kidding! I
|foskett|lost the connector from my SC1224 that way. It was broken beyond
|foskett|repair, so I had to kludge a connector with DB25s and the connector
|foskett|from my SM124... Look at the pinout in the back of your ST owner's
|foskett|manual and you'll see the differences...
Oddly enough, my best friend has a cable with all the lines... I am ,
in fact, using it right now. However, my mono is unusable because I have a
poorly sheilded 340Watt power supply that seems to be interfering with the
vysnc. It's a nice picture; it just wont stop rolling... '-)
|foskett|
|me|: Also, would anyone here be interested in a firm that sells
|me|: multisyncs suitable for ST usage for 245 bux? Sony CPD-1302's
|me|: to be exact...
|foskett|
|foskett|I sure would!
Ok... the place is called: Rich,Pikul, & Assoc.
101 Glenfield Dr
Festus, MO 63028
(314)937-0335
They're selling Sony CPD-1302's for $245+(shipping/COD). Make sure you
TELL them which kind of cable you want 9pin/15pin.

And... it's 13" tube with .26mm pitch
Max rez is 900x560

Hi everybody!

Two announcements:

1: My email adress has changed. Please adjust:
I'm still located in German Mausnetz, but at location M4 instead of K.

2: I'm on holiday until August 12.

bye, Peter

I've just sent the MiNT 1.08 sources to atari.archive. They should be
appearing there (and at other archive sites) in the near future.

The distribution conditions remain the same as for MiNT 1.04 (i.e.
source code only distribution).

Do as is said in the Xtra Ram manual. If you have 4 Meg I believe you
have to cut 4 resistors and connect them to the big capacitor at the
other end of the RAM banks.

>Should I just give up and stick the thing in a tower case? I've been

Source record: 37152
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

From some of the stuff that I have been reading on GEnie, Atari is no longer supporting the lower TOSes, they stated only current TOSes are supported,,?

I suppose this means only 2.06 and above..

One of these was in responce to problems with Works and TOS 1.2, but found to be a bug in using Lattic C, the other is the problems with the install program in SpeedoGDOS, could this also be this same Lattic C Bug..??

Also the Speedo ACC's don't work on the old TOSes, ie, the drivers.acc and outline.acc...

So you chaps with old TOSes now is the time to upgrade, the best way for old machines is to get TOS 2.06 but also use TOS 1.4 in 2 chip versions as the back up TOS, Please don't use TOS 1.0/1.2 as Back up...

also I have found the cheapest place to get TOS 2.06 UK version
is CodeHead, they have French/UK and USA versions for $60us...

They also sell the TEC board..

Can some one tell me more about the Newell Indust board, does it support switching Roms..?? also a address for Newell would be of help...

Thanks.....

Roger..... sheppard_r@kosmos.wcc.govt.nz

>
>Can anyone explain this?

As you know, accessories shouldn't really call malloc, so any memory usage above the filesize is either due to operating system requirements or expansion of the uninitialised data section.
I've no idea what the operating system requirements are, but I doubt they are more than 1K.
In Latice C5.0 about 256 bytes is taken from the uninitialised data section for the stack and nothing for the heap. In fact 256 bytes is insufficient to handle an interrupt in a BIOS or GEMDOS call and the system will crash randomly if these are used, so I suspect later versions and other compilers will grab 1K or more.
If you have any declarations like
static char buffer[1000];
these will also appear in this section and not add to the filesize.

So the most likely explanation is:
7.5K code and data (ie. filesize)
1K uninitialised declarations
10.5K stack
1K operating system

You can safely reduce the stack to what your program uses plus 1K for the operating system.

While this is probably feasible, I don't see a need to open a
virtual workstation for every window. This may be appropriate if
different graphics are to be displayed in different windows,
requiring different drawing styles. But for displaying different
texts, it may be sufficient to use a single virtual screen
workstation and a record containing info on the xywh coordinates
of the workspace of each window, and the internal positions of
the stuff displayed in the window.
I have a GFA basic routine collection assisting in this, if
your're interested, email me.

4151. Help: HD wont start up

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-12 13:10:01 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <1993Aug12.131001.10212@ibr.cs.tu-bs.de>
Source record: 37156

Yesterday i had the shock of my life:

My old Seagate ST296N didn't initialize. The motor starts up, but
no head movements. When i power down i hear the wellknown sound
of heads hitting something hard inside the HD. The green LED doesn't
show any activety.

Both powersupplies are ok 5.0 / 12.8 V.

The spindle motor makes a strange noise as if the power misses
every 5 seconds for about some ms. (Maybe a switched regulator
to control the speed?) You hear this noise only with a screwdriver
with one end on the case and the other in your ear (beware, this is
for experts only, don't mix up the ends!)

My diskmonitor does *not* find the disk (timeout).

Any hints to reanimate the controller?

>do this I would appreciate some info.

To determine how much memory the acc will use, run SIZE.TTP (provided with Laser C). The program may use uninitialized data that takes up memory but not disk space in the image.

It's good that your acc doesn't use malloc, because accessories mustn't. However, some functions in the C library (e.g., fopen) call malloc. Avoid these.

True 256 bytes is too small to cope with such things, but then since
interrupts and traps use the supervisor stack, not the user stack this is
not a problem.

>randomly if these are used, so I suspect later versions and other compilers
>will grab 1K or more.

Actually yes; current default is 4K for LC5.5 (soon to be 5.6).

From: ronjon.sircar@canrem.com
Message-ID: <60.12311.4019.0N1810C6@canrem.com>
Source record: 37161

Hi, in answer to your question, the Seagate ST-157N is a 3.5 inch SCSI hard disk, you can replace it with any 3.5 inch SCSI hard drive of any make, all SCSI hard drive mad nowadays have an embedded controller and the same interface so it's very simple to hook the new drive onto the built in host adapter in the Mega STe.

4158. SECOND LUN IN A MEGAFILE

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-13 02:55:00 UTC
From: ronjon.sircar@canrem.com
Message-ID: <60.12312.4019.0N1810C7@canrem.com>
Source record: 37162

Hi all, has anyone tried adding a second HD to a Megafile?, I did it partially successfully with my Megafile 30 by adding the second data header (20 pin) and changing the cabling to allow for the extra drive to get power and for the controller cable to send signals to both drives. I used ICD's Pro Utilities to format the second LUN as Atari's doesn't have the option, all of this worked perfectly untill today, for some reason the second LUN failed this afternoon, don't know why, anyway for anyone with an atari branded drive here's what you need: a 20 pin header (10x10 pin) a second 20 pin data cable, a y shaped power cable, and a y shaped 34 pin controller cable, in a Megafile you must make the second unit a 3.5 inch drive (megafile 20 needs an MFM drive all other Megafiles use RLL) for SH series, I don't know if the spot is available on the controller but if it is and ther's space you need an MFM drive, you must bend up part of the sheilding and rest the left (facing away from you) corner of the drive on the LED post you also need new formatting software ICD's Pro utilities will work, also Supra's may, not the regular ICD software as it looks for an ICD host adapter.

[>
[> I think you should tell the compiler to compile with x Kb of memory usage. I
[> There must be some option to do that. BTW, what does the accessory do?
[>
[> Greetings, Tim

This is actually normal, in most situations. Here is an example that
explains why (more or less):

```
/* SILLY.C */

#include <stdio.h>

void main()
{

long hugelong[25000];

printf("This program just displays this message, yet because,\n"
printf("yet it uses more than 50K of memory when it runs.\n");

}
```

The size of a program does not correspond to the memory that it uses,
since you have to take into account variables, and library code that
grabs chunks of memory by itself. See what I mean? The printf()
command uses extra memory so that it can process the string you give
it (which is done at runtime). A lot of functions grab memory for
themselves, as well.

From: Chris_Clee@redact.uucp
Message-ID: <Chris_Clee-130893092531@89.32.34.5>
Source record: 37163

My problem: I want to connect a high-resolution, monochrome monitor to my Atari 1040 STFM that I've just bought second hand, but I don't want to pay the over-inflated prices being asked by the dealers.

Does anybody know whether you can connect a regular monochrome monitor (e.g. from a PC) to the Atari's monitor port ? If so, how ? Are there any pitfalls to watch out for ?

Any help/suggestions greatly appreciated.

Cheers,

Chris.

Hello person,

About a week ago I mailed you a driver for your Moniterm 19" screen in a
sort of UUEncoded way. Did you get it and -if so- is it of any use to you?

Paul

> Does anybody know whether you can connect a regular monochrome monitor
> (e.g. from a PC) to the Atari's monitor port ? If so, how ? Are there any
> pitfalls to watch out for ?

A long time ago, I managed to connect a standard monochrome composite video monitor to a STFM, but I'm a bit vague on the details now. I think I simply soldered together the R, G, B, vsync and hsync lines from the ST's monitor port and connected the lot to the monitor's signal line (then connected the monitor's earth to the port's earth of course). I suspect I needed a resistance of several hundred ohms in parallel with the monitor as well.
I DO remember that using the `composite video' line from the monitor port gave bad results.
All this only works in low or medium resolution, since a standard monitor cannot take the 70Hz demanded by hi-res. No way round that I think.

I hope this helps.

Oliver.

PS. This is definitely the kludge solution. I daresay better ways exist, but it worked fine for me.

4167. (re)drawing icons

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-13 14:40:19 UTC
From: jansteen@cwi.nl
Message-ID: <10948@charon.cwi.nl>
Source record: 37167

Some time ago (about a week) I asked:

> I just added icons to my application by creating object's with the
> "ob_spec" field pointing to an ICONBLK type structure, and setting
> the "ob_type" field to G_ICON. Next, I display the object using:
>
> objc_draw(icon, 0, DEEP_ENOUGH, SETARG(rect));
>
> After having implemented all this, I noticed while testing the
> program, that the graphical instance of these objects are disturbed
> by window movements on the screen. So, what was basically my faulty
> assumption is that the screen manager doesn't redraw these icon
> objects for me.

I want to thank the following people for pointing out to me the
solution for this problem:

r.mellish@ic.ac.uk
timg@emx.cc.utexas.edu (Tim Gallivan)
R_Tim_Coslet@cup.portal.com
warwick@cs.uq.oz.au (Warwick Allison)
apelled@cix.compulink.co.uk (Adam Pelled)
gutschk@uni-muenster.de (Markus Gutschke)
evanlang@sdf.lonestar.org (Evan Langlois)

The clue of desktop icons is to replace the desktop object (datatype
OBJECT) with a user-defined object and make the desktop icons children
of this object. Since AES knows about the new desktop, it will redraw
it (including the icon children) properly in all circumstances.

Thanks again to all whom responded,
Jan van der Steen

Below are some implementation details:

```
void
win_desktop(desktop)
/*
* Set our private version of the desktop (or restore it)
*/
OBJECT *desktop;
{
int desk[4];

if (desktop == NULL) {
wind_set(0, WF_NEWDESK, 0, 0, 0, 0);
return;
```

```
}
memcpy(desk, win_desk(), sizeof(desk));
wind_set(0, WF_NEWDESK,
(int)(((long) desktop & 0xffff0000L) >> 16),
(int)(((long) desktop & 0xffff )), 0, 0);
objc_draw(desktop, 0, 0, SETARG(desk));
}
```

The icons are added or removed by using the AES calls:

```
/*
* Establish link with the desktop
*/
objc_add(desktop, 0, n);

/*
* Remove the object from the desktop object list
*/
objc_delete(desktop, n);
```

In these calls n is the index of the icon object. Being an index AES assumes that all objects related to the same object tree are seperated sizeof(OBJECT) bytes apart. This implies that both the desktop object and the icon objects should be allocated in a contiguous piece of memory:

```
/*
* Allocate the desktop + ICON_MAX icon OBJECT's
*/
if ((desktop = calloc(1+ICON_MAX, sizeof(OBJECT))) == NULL) {
message("icon_desktop(): out of memory");
return NULL;
}
```

This imposes the limit on the user having a maximum of ICON_MAX icons on the desktop at the same time. Being an array of OBJECTS makes it possible to get the index of an icon by using simple pointer arithmics:

```
icon_show(icon)
OBJECT *icon;
{
int n = (desktop - icon); /* Index of icon w.r.t. desktop */

objc_add(desktop, 0, n);
icon_redraw(icon_rect(icon));
}
```

The icon_redraw() function redraws the icon_rect() rectangle part of the desktop (the bounding box of the icon) asking AES what *can* be redrawn using the famous loop:

```
icon_redraw(rect)
int rect[];
```

```
{
int part[4];

for (wind_get(ROOT, WF_FIRSTXYWH, GETARG(part));
part[2] > 0 && part[3] > 0;
wind_get(ROOT, WF_NEXTXYWH, GETARG(part))) {

/*
* Get intersection of rect and part
* and draw the icon using objc_draw()
*/

}
}
```

BTW. The design choice to refer to children and parents using indices instead of addresses saves 6 bytes per OBJECT datatype but limits the size of one object tree to 32768 bytes (ie. MAX_SIGNED_INT). Whether or not this choice was sensible is different issue, but for me personally I would have prefered pointers instead of indices. It would have been easier to create/shuffle object trees on the fly.

4168. RAM Upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-13 16:20:12 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug13.162012.102158@zeus.calpoly.edu>
Source record: 37168

Does anyone have experience with the JRI memory expansion board? I have installed it and gotten it working ok (it doesnt help that my ST seems to have some flakey ROM problem. The ROMS themselves are deffinately OK, but every now and then I get bombs (2, 4, 6, 40), and have to take out the ROMS and reseat them - anyone know about this). Ack, anyhow, I still need to fool with the JRI some, but when I first got it working, I got some pixels flashing on the screen. JRI says on one of their sheets that the MMU could be overloaded. But it only lists this as a problem on the ST boards with the RAM under the keyboard (and 1 MB at that). I started with a 520STFM a while ago. I added .5MB on the board (16 chips and 3 resistors).

For the JRI expansion I had to remove the three resistors, so .5 MB of extra RAM is on the motherboard but not getting power. Possibly these can still cause the MMU to work to hard (serious fan out on some of the pins). If anyone has some experience with this let me know. (I hate to take of the .5MB on the motherboard that I added, because I did not socket the chips, and it was a pretty major effort!

Thanks.

Mike

4169. Re: How to Legally do Raster Ops under AES

Newsgroup: comp.sys.atari.st.tech

From: D.Oakley-SE1@cs.bham.ac.uk
Message-ID: <CBpo7y.5qM@cs.bham.ac.uk>
Source record: 37169

I have been trying to use vrt_copyfm (can't remember whether that's exactly right) to blit a small raster from a word array to the screen. Thus the source screen is 1 word, 16 pixels wide, blitting to the screen using address NULL as mentioned above.
It works fine with vro_copy, but when using vrt to my mono monitor it rather wierdly gets the logical op wrong, so it XORs ratheer than the usual dest copy. Why?. Can't I use vrt when blitting from 1 plane to 1 plane? Are the logic op numbers different? I can't think that either of these are the case, so what?

I'm using Lattice C5.52.

BTW I rang Hisoft yestermorning and was informaed that Falcon/MTOS Lattice, Devpac etc should be ready in less than a month. The manuals are at the printers. At last!!!

Seeya,
David. PS, Please reply with mail, to...

Hi,

After wrestling some time with Hermes and UUCICO 3.4x I found it
contained a small flaw (bug is too big a word), which kept me from
succesfully logging in onto my host. My hopes of getting UUCP to work on ye
olde Atari raised again when I was told an update came available; a version
3.72 which could have outgrown it's small but annoying
shortcoming. Maybe.
Does anyone know where this version can be obtained?

thanks,

Paul

What reference sources are available for the Atari 68000 systems? I have an old copy of "Atari ST Internals", a few GEM books, and the original developers docs I received in 1985 or so.

I was wondering if there was something more recent that was recommended and discussed portability issues (e.g. don't use the line-A routines anymore) across machines, how to access specialized hardware, etc???

In Germany, you can get a TOS Extension Card *with* ROMs *and* builtin
IDE drive adapter (Falcon compatible) for 180 DM (~ 110 $). This might
be interesting for those who stll have no hard drive.

The problem was definitely not a bug in Lattice C, it was a bug in some
libraries that Atari was using internally. Perhaps someone confused those
(Atari produced) libraries with the Lattice library. The Lattice library
and compiler were definitely *not* at fault.

As for support of older TOSes; we probably will drop support for TOS 1.0
and TOS 1.2 at some time, but so far as I know that time has not yet
come. I would strongly urge people to upgrade to at least TOS 1.4 now,
though (TOS 2.06 would be even better, obviously).

I think you could find a way of connecting a Monochrome VGA monitor as
I think the newer Atari one was simply a rebadged VGA-Mono monitor. I
don't have any details, though I know of someone who has done it.

Cheers,

Source record: 37179

A good friend of mine who owns an Atari ST asked me to pass this question along.

He has a Data Technology Corporation hard disk and is trying to re-format it on his machine using several shareware formatters.

The only problem is that the default parameters limit the capacity to 5 megs even if the drive is capable of holding more. He needs a way to access the parameters and change them so that the disk will format properly.

Does anyone know how to access/modify the parameters of a DTC 510 hard disk unit?

Answers are appreciated in advance. Thanks.

kirky

[lots of other hassle deleted]

Why not create the complete desktop with a RSC editor, including all the icons? Then you only have to install the desktop, and can use the HIDE flag to hide or unhide icons. A much cleaner solution imo... Except when you *really* need to create icons on the fly of course

And probably you could force a redraw of the desktop icons using a form_dial(FMD_FINISH...) call, with the desktop as tree (0), and the bounding rectangle of the icon as x,y,w,h -- but I'm not 100% sure of this. At least it would spare you the effort of manually walking the rectangle list for desktop objects.

I see that there is a update for C-KERMIT its now 5A 189, there is even a update for the Amiga...

So come on you Atari fanactics/Bigots were is the Atari version..??

Or is it more like there is no more support for Atari in the USA any more..??

I also read in the old version that they did not know how to read the DTE speed, well its true for old TOS 1.0 or 1.2, but from memory you can with a call to Rsconf, with baud = -1..

May be some one should tell the person that did the last port of C-Kermit, and also follow the lead in not supporting TOS 1.0 and 1.2..

There is one thing that I would like Atari to do is to make available TOS 1.4 UK in 2 chip sets, from what I have read, they are almost impossible to get..

The reason could be that you can only get TOS 1.4 2 chip sets in ROMS and not EPROMS, any one can blow EPROMS but not ROMs...

Roger.............. sheppard_r@kosmos.wcc.govt.nz

Sounds like the SCSI interface controller isn't coming up. You might try reseating the ROM chip on the hard drive. For that matter try reseating anything in a socket. Other than that, it's probably skragged.

I have a few Mega ST computers with "blown" PS units.
They are presently powered by salvaged IBM PC power supplies, but this is becoming impractical!

I'm discarding all my external hard drives in favor of an internal hard drive and host adapter, for portability. A large external PS and umbilical cord just doesn't fit the picture!

I think the problem is that the stock Power Supply can't handle 4MB of mamory in addition to a GCR and... the future internal drive. Heck... the PSs died within a year of adding the 4MB!!! (started with 2MB).

Anyhow. Has anyone experienced an INTERNAL PS upgrade?! I'd like to add an SST or other 68030 along with a Moniterm or equivalent!!!! But I'd like an internal PS!!!

4186. korn-ny characters

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-14 18:39:45 UTC
From: giggey@ecf.toronto.edu
Message-ID: <CBrII9.68s@ecf.toronto.edu>
Source record: 37184

s anyone able to help me?

I am running mint .95. When it is in the TOSWIN(?) and I try to type characters (ie to run a programme or application) some of the characters seem to be just black squares.

I am interested in finding out what causes this and how to solve the situation.

Also, but unrelated is the fact that I would very much like to convert KAOS into english (it is a german OS). Is there some 'patch' file that I could use to change the prompts into english and to map the keyboard, once again, into english?

Any help appreciated, greatly.

Thanks in advance for help.

mike

4187. problem with qsort in gcc library

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-14 18:52:49 UTC
From: bnell@scr.siemens.com
Message-ID: <CBrJ42.ID9@scr.siemens.com>
Source record: 37186

I'm having a problem getting qsort to work at all. Here is a simple
test program that won't work for me.

```
#include <stdlib.h>

int cmp(int a, int b)
{
return (a == b) ? 0 : ((a < b) ? -1 : 1);
}

main()
{
int a[] = { 5, 7, 3, 0, 2, 8 };
int i;

qsort(a, 6, sizeof(int), cmp);
for(i = 0; i < 6; i++)
printf("%d\n", a[i]);
}
```

The array remains unchanged. So, does anyone know what the problem is??

Thanks,
Bill

4188. Bug in latest MiNTlibs/GCC?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-14 20:20:24 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.eg.d5D8DxQalrg@semprini.tdkcs.waterloo.on.ca>
Source record: 37187

Using the latest MiNTlibs (pl30?) and GCC (2.4.4?), with -mshort,
sizeof(anything) returns 0. sizeof() works properly without -mshort.

Has anyone else run into this problem?

For those people who've had problems getting working executables with
this version of GCC, try taking -mshort out of your CFLAGS.

4191. Need real time clock routine for midi sequencer

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-15 00:44:26 UTC
From: apolivka@x102a.ess.harris.com
Message-ID: <1993Aug15.004426.26685@mlb.semi.harris.com>
Source record: 37191

I want to write some software for my ST that somewhat resembles a midi sequencer. I've written other midi software, but never anything requiring a real time clock. Can anyone tell me how to do this or point me to some public domain source code containing such a routine?

Specifically, I just need to know how to generate a trigger of some sort every X milliseconds (where X is adjustable by the user prior to running the sequencer-like program). I know how to do the rest of the program. (I would use the trigger to wake up my routine that sends out a midi message.)

I will be writing in Personal Pascal (because I am most comfortable with that language package).

This is definitely not Ckermit 5A(189). 189 only came out a few
weeks ago. Note the January 7, 1993 date. I would hazard a
guess that this is (185).

Cheers,

Chris

Not necessarilly. I happen to know from hard experience that the OS uses the user stack during traps. I don't know why, but I DO know that if you run less than about 3.5 to 4 k of stack (plus your own needs) you WILL crash, sometimes randomly, or mabe not, but you WILL crash at some point.

4197. TOS Partitions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-15 15:16:00 UTC
From: wojci_g@pavo.concordia.ca
Message-ID: <15AUG199310162199@pavo.concordia.ca>
Source record: 37196

Hi,

A while back I asked if anyone knew how large a partition can TOS support. Just recently I got an interesting book (Hard Disk Secrets by John M. Goodman) that shed some light on how hard disks work. Right now I am using a 48 meg ST-157N and the largest partition that I have is 15 meg using a 16-bit FAT table. If I have it right then a 16-bit number limits the logical sector numbers to 65,536. Where the sector size is 512 bytes, the logical volumes of size of up to 32 MB can be supported. With a 32-bit FAT, 2^32*512/2^20 = 209715 MB partitions should be possible. Can 32-bit FAT tables be used with Ataris? Can anyone answer this question?

Woj. (wojci_g@pavo.concordia.ca)

>have it right then a 16-bit number limits the logical sector numbers to 65,536.

Due to a bug in TOS 1.00 and 1.02 the maximum sector number is 32767 when
using these TOS version.

>be possible. Can 32-bit FAT tables be used with Ataris? Can anyone answer this
>question?

No, 32 bit FATs are not supported.

The maximum partition size under TOS 1.00 or 1.02 is 256 MB and 512 MB for
TOS 1.04 and higher. AHDI 3.00 compatible harddisk drivers don't use another
FAT format for big partitions but work with logical sector sizes up to 8192
KB per sector. This format is described in the AHDI 3.00 Release Notes from
1989, so this format has been used for several years now.

> (int)(((long) desktop & 0xffff )), 0, 0);
**> objc_draw(desktop, 0, 0, SETARG(desk));
> }
```

The last objc_draw() is not quite right. You need to take care of the rectangle list for the desktop, since in MultiTOS, there may be windows open at the time you do this objc_draw() call.

So the ** line should extend to

```
wind_get( 0, WF_FIRSTXYWH, <rectangle> );

while ( <rectangle_width> || <rectangle_height> ) {
objc_draw( desktop, 0, 0, <rectangle> );
wind_get( 0, WF_NEXTXYWH, <rectangle> );
}
```

bye, Peter

>about hardware? Could I get a German TEC to work in my US ST?

Nes. Yo. Perhaps. :-)

Drawbacks are: You'll get quite a fancy keyboard mapping, and: German ROMs
contain wrong information about PAL or NTSC machine, since German machines are
PAL an US STs are NTSC.

But you could get yourself an empty TEC and stick US ROMs in.

>Also,
>there's a place which advertised in ST Format that they sell British
>STE motherboards... Since my STf seems pretty dead (motherboard
>problem) could I get an STE motherboard and hook a power supply and my

4201. GCC and GDB use questions.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-15 17:04:53 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <24lqbl$c9q@geraldo.cc.utexas.edu>
Source record: 37199

Hi. Can experienced GCC and GDB users help with any of these questions?

1.) Is there a way to replace a gnulib routine with one of my own without manually rebuilding the gnu.olb file? I just want the loader to load the routine in the source file instead of the one in the library. Right now I get an error about multiply defined symbols.

2.) Is there a way to link many small object modules into a single object module (NOT an executable), which can then later be linked with other object modules? I don't want to have to link 100 object modules together everytime I make changes to a single file.

3.) No version of GDB that I have ever used, including the mint-only port of 3.6 (by Andreas Schwab) can properly access global variables. Local variables are accessed correctly, but global variables just print junk, as if a pointer to them referenced some random place in memory. Does anyone know anything about this phenomenon? I have a 4M 520 with TOS 1.0.

Thanks for any help.

-Tim Gallivan

>Right now I get an error about multiply defined symbols.
>

I'm not sure but I think gnu.olb is an archive which you should be
able to change using gcc-ar.ttp. I haven't tried this yet, though. Someone
else can probably help more there.

>2.) Is there a way to link many small object modules into a single
>object module (NOT an executable), which can then later be linked with

This is definitely something you should be able to do with gcc-ar.
Just create a library of .o files into a single archive. I recently
built up Objective-C and got the libraries working fine.. so you should
able to do this.

Most SCSI drives will probably work just fine. However, the "SR" series
(7120SR, 7213SR, etc.) Maxtor drives appearantly do not.

4205. TOS Partitions 2

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-16 03:39:00 UTC
From: wojci_g@pavo.concordia.ca
Message-ID: <15AUG199322393106@pavo.concordia.ca>
Source record: 37202

I think that I found an answer to my previous question. When handling 'normal' partitions (less than 32 meg), TOS maintains the cluster size of 2 sectors. As soon as the logical limit of 32 megabytes is exceeded, TOS starts to use more sectors per cluster but always in integer multiples of 2, ie; 2,4,6,8.

So far I have never seen a 32-bit FAT table. 12-bit is usually reserved for floppies and 16-bit for hard drive partitions.

Hmm, did I present the above in a correct way? Please correct me if you find anything wrong.

Woj. (wojci_g@pavo.concordia.ca)

```
>int cmp(int a, int b)
>{
> return (a == b) ? 0 : ((a < b) ? -1 : 1);
>}

...
> qsort(a, 6, sizeof(int), cmp);
```

cmp needs take POINTERS to the objects to compare.
ie:

```
int cmp(int* a, int* b)
{
return (*a == *b) ? 0 : ((*a < *b) ? -1 : 1);
}
```

The reason why the array remained unsorted was that the ADDRESSES of the objects in the array are, of course, in increasing order!

MORAL of the story:

1st: Suspect a bug in your own code.
2nd: Suspect a bug in the libraries.
3rd: Suspect a bug in the compiler.

Tens of thousands of people use GCC and the GNU libraries, so bugs are pretty rare (although I found one in the TOS versions of the lib which weren't in the standard GNU versions).

Just get GCC and the MiNTlib34. That's all you need. As far as I know you can
also use the GNUlib. Yacc/Bison is not needed because there is a asmtrans.ttp
woth the MiNT sources.

Yeah, the logic ops for vrt_cpyfm are the ones you use for vswr_mode!
ie use MD_REPLACE instead of D_ONLY (etc) That's bitten me at least
once :-(

Has someone of these tens thousands of people discovered that the gnu
qsort compares entries with themself? I sorted a list of file names and
I was shure to have no dulplicate names in the list, therefore I did
not set the possibility to return NULL. The effect was a crash. With
the possibility to return NULL it works fine. But I think it would be
faster if we would check for equal pointers in the lib source. Could someone
change this in the lib? I feel no pleasure in compiling the whole lib
to test it out.

|> We have two st in which the drives have gone bad and I seem to remember
|> someone posting that they had fitted a 1.4 meg drive though it only
|> formatted to 720k but worked ok.

I`m currently working with a 1.44 Meg drive; as i have not invested in
any additional Hardware yet, it only works up to 720K.

There where no special problems; I had to cut a bigger whole in the
casing and turn the plug around (red line of Shugart cable has to be on
pin 1); that turning might pose a problem, because the cable is not very
long. You also might have to experiment with the jumper-settings on the
new floppy drive, but a little try and error will do !

Greetings,
Thomas Wollersberger

>themselves, as well.

A couple of problems here - first of all hugelong will be allocated on the
stack which is a fixed size - the size of hugelong is irrelevant. Only static
and global variables have memory "allocated" for them at run-time.

Secondly you cannot do any buffered file io (which printf is) from an
accessory because none of the initialisation is done in the desktop accessory
startup code.
```

Thirdly any memory allocated by accessories (ie. malloc()) must come from a fixed heap because desktop accessories shouldn't call Malloc().

However, if we were talking about a normal program your comments about printf would be valid, although the buffer file io tables are probably more signifiacant memory users.

You should use something like printf ("%ld", sizeof(anything)) (note
the ell!) for printing. sizeof(x) is of type size_t which is unsigned
long always.

[stuff deleted]

qsort passes pointers, not integers to cmp. Try

int cmp(int *a, int *b)
{
return (*a == *b) ? 0 : ((*a < *b) ? -1 : 1);
}

Steven
```

4215. FALCON HD Problems..!!

I read about a mouth ago from a Bob Brodie RTC on GEnie,
that they had stoped shipping Falcon computers, because of
Hard Drive problems, they even called in the manufactures of the Hard Drives...

Well I have since read the reason in the latest GEnie Lamp Magazine (360)

there were problem with the Hard Disk RF sheild was causing
Electrical Interference to the Hard Drive, (spin-ups spin-downs)
there is mentioned a Dealer modification or Fix, but there were
no details given...

May be some one could give others here the Fix for this, the users that brought
there machines by mail order from overseas...

Could this be another reason that Atari droped the 60 meg drive
for a 80 meg one..??

Roger.............. sheppard_r@kosmos.wcc.govt.nz

4216. Re: problem with qsort in gcc library

>{
> return (a == b) ? 0 : ((a < b) ? -1 : 1);
>}

qsort() passes pointers to the arguments to be compared to the comparing
function, called cmp() in this example. Therefore, you should use
something like

```
int cmp(const void *a, const void *b)
{
return (*((int *) a) == *((int *) b)) ? 0 : ((*((int *) a) < *((int *) b)) ? -1 : 1);
}
```

I think this is the proper way of using qsort -- cmp() should take void
pointers to allow qsort to be written for arrays of elements of any
type.
As a hint, gcc often issues warnings that direct you to the source of
problems if you use the gcc -Wall compiler flag. It has worked quite
well for me on several occasions.

Hope this info helps,

4217. Palette handling on the TT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-16 12:44:58 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <CBurEy.I1p@news.chalmers.se>
Source record: 37215

Is the palette handling the same on the TT as on the Falcon?
I'm using the VsetRGB and VgetRGB calls right now, but will this work on a TT?

By the way, mgif 4.3 is not too far from release.
Now with better greyscale support, more speed, targa/ppm read, slide show and
colour! I guess the name ought to be changed. ;-)
If you own a TT and would like to beta test mgif 4.3, please let me know.

GEMULATOR VERSION 3.0
The Atari ST Emulation Card For PC Compatibles

Branch Always Software
14150 N.E. 20th Street, Suite 302
Bellevue, WA 98007, U.S.A.

- NEW FEATURES AND ENHANCEMENTS

- SEE IT AT THE GLENDALE SHOW

- NEW DEMONSTRATION VIDEO

- LOW UPGRADE PRICE

- FREE NEWSLETTER

Branch Always Software announces Gemulator 3.0, the Atari ST emulator for PC compatibles. With standard features such as TOS 2.06, SuperVGA color graphics, 1.44 megabyte floppy disk support, and expandability up to 8 megabytes of RAM, Gemulator 3.0 turns a plain 386 or 486 PC into an awesome Atari ST clone. With PC prices at an all time low, there has never been a better time to "gemulate" your PC, especially when you consider the cost of upgrading an existing ST with TOS 2.06, high density floppy, extra memory, etc.

Gemulator 3.0 will be released on September 18th 1993, at the Glendale Atari Show in Glendale California. The price remains at $229 U.S. complete and will be available from various Atari dealers. Current Gemulator users can upgrade to version 3.0 for only $30 before September 3, and only $10 if the product was purchased after July 1.

Gemulator 3.0 consists of a plug-in card, TOS 2.06 ROMs, Atari ST emulation software, Atari 800 emulation software, a screen accelerator, benchmarking software, and some public domain and shareware Atari ST programs. Simply plug the card into any unused 8-bit or 16-bit card slot and run the emulation software. GO FROM DOS TO GEM IN SECONDS!

Any PC or laptop meeting the following requirements can run Gemulator 3.0:

- a 33 Mhz 386 processor (or faster)
- at least 4 megabytes of RAM
- DOS 5, DOS 6, Windows 3.1, or OS/2 2.1
- a VGA card and VGA monitor (SuperVGA is optional)
- one empty 8-bit or 16-bit ISA card slot
- a hard disk and at least a 720K 3.5" floppy disk
- an AdLib or Sound Blaster sound card is optional
- a mouse is optional but recommened for use with GEM based programs

The following features of the Atari ST / STE / Mega ST are emulated by Gemulator 3.0:

- 3 graphics modes (320x200, 640x200, and 640x400)
- a 4096 color palette
- one or two floppy disk drives
- support for up to 4 hard disk partitions
- one serial port and one parallel printer port
- 3 voices of sound
- mouse and keyboard (including numeric keypad)
- real time clock
- ROM based cartridges
- 512K to 8 megabytes of RAM

Gemulator 3.0 also adds these enhancements not found on your standard ST:

- 640x480 color graphics (with any VGA card)
- 800x600 color graphics (Video7, ATI, Tseng, or VESA SuperVGA card)
- maximum ST memory is 8 megabytes, double the limit of an ST
- 1.44 meg high density floppy disks are supported
- support for multiple TOS ROMs

Imagine running any of hundreds of Atari ST and Atari 800 programs on your PC, including (but not limited to) these:

ArcShell Multi Writer
Avante Vector Multidesk
Calamus MultiTOS (68000 compatible versions)
Calamus SL Neodesk
Codehead Utilities NVDI
Data Master Pagestream
DC Desktop Pha$ar
DC Utilties Prism Paint
Degas Publishing Partner
Degas Elite Quick Index
Deskcart Quick Manager
Diamond Back II Quick ST
Extended Control Panel Quick View
EZ Calc Silhouette
First Word ST Writer
First Word Plus ST Xformer II
Flash Sudden View

FontGDOS Supra hard disk utilities
G+Plus Tempus
GDOS Tempus II
GemBench Thunder
GEMvelope TOS 1.0
GFA Basic TOS 1.2
Gribnif Geneva TOS 1.4
HDX hard disk utilities TOS 1.6
Hotwire TOS 2.06
Interlink Turbo ST
Key Master UIS III
Laser C VT52 Emulator
LDW Power Warp 9
LHArc Word Flair
Madmac Word Flair II
Magic Sac Word Up
Maxifile Word Writer

About the only things that Gemulator 3.0 does NOT support are MIDI ports, copy protected disks (typically games), and very machine specific or timing dependent software such as Spectrum 512.

With 8 ROM sockets on each Gemulator card, there is plenty of room for you to plug in other versions of TOS and cartridge ROMs. If you have particular software that does not run with TOS 2.06, you can easily plug in TOS 1.0 or TOS 1.4 and use it instead. Or if you have cartridges like Deskcart, simply remove the ROMs from the cartridge and plug it into the Gemulator card. Gemulator 3.0 can automatically detect up to 4 cards, providing you with a total of 32 ROM sockets!

On fast 486 machines, Gemulator 3.0 runs 2 to 3 times faster than the ST. It scores a GemBench speed index of over 270% running on a 66 Mhz 486 based PC. That's without the use of accelerators such as Warp 9 or NVDI, which are supported on Gemulator and give similar speed improvements as on a real ST. If you don't have a copy of Warp 9 or NVDI, don't worry. Gemulator 3.0 comes with its own custom screen accelerator which runs even fast (it is similar to our Quick ST accelerator but optimized using 386 machine language).

In addition to the 3 standard Atari ST screen resolutions, Gemulator 3.0 also supports 4 VGA screen resolutions: 640x480 monochrome, 640x480 16 colors out of a 4096 color palette, 800x600 monochrome, and 800x600 16 colors out of a 4096 color palette. If you run your Atari ST software in the 800x600 mode you get almost double the screen resolution of a monochrome Atari ST monitor. Twice the pixels means twice as much text visible on the screen or twice as much area of a desktop publishing document.

Gemulator 3.0 now supports the serial port allowing you to run your favorite Atari ST terminal software with your modem. Take advantage of such features as auto redial, type ahead buffers, and editable capture buffers, features not found in most PC telecommunications software.

Gemulator 3.0 emulates the Atari ST's 3 voice sound by using your PC's Sound Blaster, Sound Blaster Pro, AdLib, or AdLib compatible sound card. Simply have a sound card installed and Gemulator 3.0 will use it.

Gemulator 3.0 reads your Atari ST floppy disks directly, and now gives your Atari ST software access to all of your PC's hard disk drives. Simply use your existing Supra or HDX hard disk driver to activate the hard disk support. And using the HINSTALL utility (which is part of the HDX utilities) you can even autoboot from the hard disk allowing you to put your AUTO folder programs and desk accessories on the hard disk.

And if you're a die hard Atari 800 user, you'll be glad to learn that Gemulator 3.0's improved compatibility now allows you to run the ST Xformer emulator on it. Run Atari BASIC, DOS 2.5, and any other program that is supported by ST Xformer. We include a free copy of ST Xformer 3.0, an upgrade from ST Xformer 2.55, which contains several bug fixes and speed improvements.

Interested in finding out even more about Gemulator 3.0? We now have a free 5 page newsletter which describes more of Gemulator 3.0's features in detail. To receive the newsletter, write to:

Gemulator 3.0, c/o Branch Always Software
14150 N.E. 20th Street, Suite 302
Bellevue, WA 98007
United States of America

We are also updating our demo video to include Gemulator 3.0's latest features. The demo is available on VHS videotape for only $20 and may be ordered directly from Branch Always Software at the above address.

All current Gemulator users may upgrade to version 3.0 for only $30 before September 3, 1993. Users who purchased Gemulator after July 1, 1993 may upgrade for the even lower fee of only $10 with a copy of your receipt showing the date of purchase. After September 3, 1993 all upgrades are $60.

Gemulator 3.0 will be shown September 18th and 19th at the Glendale Atarifest at the Glendale Civic Auditorium. Drop by the Branch Always Software booth to say hi or to pick up your Gemulator. We'll even be taping part of our demo video at the show to get real life reactions from Atari users using Gemulator 3.0.

In North America, Gemulator 3.0 can be ordered from the following dealers:

Toad Computers
570-F Ritchie Highway
Severna Park, MD 21146
phone: 800-448-8623 fax: 410-544-1329

Rising Star Computers

Xanth Computers
14100 NE 20th St. #105
Bellevue, WA 98007
phone: 206-643-9697

In the United Kingdom, Gemulator 3.0 is available from:

ST Club
2 Broadway
Nottingham NG1 1PS
phone: +44 0602 410241 fax: +44 0602 241515

In Europe Gemulator 3.0 is distributed by:

ACN
Postbus 5011
NL-2000 CA Haarlem
The Netherlands
phone: +31 023 351100 fax: +31 023 361444

ACN provides Gemulator packages for the U.K. as well as versions translated into French and German with appropriate TOS 2.06 ROMs.

Users of the GEnie online service can come ask questions about Gemulator 3.0 on August 18th at 10pm during a special RTC in the Atari ST roundtable.

If you wish to call Branch Always Software, we may be reached at 206-885-5893. This is a voice number before 2pm eastern time and a fax number at other times.

4219. REQ: SW for readindg ST roms

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-16 15:09:24 UTC
From: tyjori@uta.fi
Message-ID: <24o7v4$pg0@vuokko.uta.fi>
Source record: 37217

I've been heard that there is software for reading ROMs to file.
The very idea is read ROMs from ST and make ROM update with prommer.
Yes, I know that's is copying but I certainly pay for upgrading, Do I ?

True enough. It isn't necessary to open one virtual workstation per window.

I have many answers and anyone who has not been e-mailed a thankyou note can expect one in the next few days.

I am buying another scsi disc instead as i have been convinced that trashing a working system is a waste. Still, two working systems are probably better than one.

Bye again.

4222. Re: is my Sun scsi harddisc compatable

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-16 19:22:20 UTC
From: mjr@geob8.geo.uni-bonn.de
Message-ID: <GMT16Aug.93.30664@work1.rhrz.uni-bonn.de>
Source record: 37219

One important point was missing in the followups i read:

there are some possible pitfalls when You attach a scsi device from an old workstation to an atari: most of the host adapters for the st's ran in asynchronous mode (i dunno about the falcon) while at least my sparc 1+ uses synchronous mode to transfer the data (twice the speed). I tend to suspect the sun 3 as an old, formerly expensive, product to use synchronous transfer as well. An independent issue is parity check on/off. Most st hostadapters need parity check disabled. My sparc 1+ needs it enabled.

All this can usually be selected by jumpers, but you need the documentation of the drive to do it. In any case You really should check these points.

Though this looks like a great product, its flaws (which are freely and openly advertised by Darek, to his credit) are:

1. No joystick support (scratch any idea of playing most atari games on your PC).

2. Can't read some copy protected disks (ditto).

3. No MIDI (though I don't think anyone would buy it for MIDI anyways).

4. Doesn't support Spectre GCR, "at the request of Dave Small". I take this to mean that it easily could support Spectre, but Dave said "don't do it or I'll sue you". I think Dave Small is missing the boat here -- a mac emulator for the PC at this price would sell big in the PC world.

Anyways, if Darek could fix the joystick support, I'd buy one of these things.

>else can probably help more there.

Yes, gnu.olb is an object library, you can replace individual object files
within it using gcc-ar. However, if the routine causing your problem is in an
object file that also contains a number of other routines, you can't get
around it so easily. Unfortunately, the linker works on an object file basis,
not on a symbol-name/object basis. You might have, for example, your own
printf routine in your file printf.c, and when you link in your program, your
printf.o, and then the gnu.olb, you encounter a conflict because the library
has printf, fprintf, and sprintf all in a single object file, and some other
part of the program needs fprintf or sprintf. (Sorry for the lengthy sentence.
Also, I doubt that this specific example is true in the current library...)
Once the linker has to pull in an object file to get sprintf, it suddenly finds
a second definition of printf, and it complains, as it should.

One of the things I'd like to change in the GNU .o file format is to add a
.size attribute to every symbol. That would allow the linker to always pull in
only the required symbols from an object library, thus avoiding this multiple
definition problem...
>

>able to do this.

You've described how to create an object library, which is fine for most cases.
But if you're really interested in incremental linking, which is what it sounds
like to me, then you need to use gcc-ld, and you want to use the "-r" flag.
This will link all of the given object files into a single file, but preserves
all the relocation info so that the resulting file can be used for linking

again at a later time. It also suppresses the check for undefined symbols. This linked file will allow further linking to occur much more quickly than with a library file.

I took that to mean that to. I talked to Dave Small at WAACE this year, and that was the distict impression I got. I think there's some bad blood between the two for some reason. Then again, Derek seemed to be all but promising Spectre support and I asked Dave Small about it and he hadn't heard ANYTHING about it at the time. Spectre will not run on Gemulator without patching the code...and Dave said he WOULD sue over that, and that he probably would NOT do it himself.

Doesn't Dave make all his money from selling the Spectre Hardware and not the software? If so, how would he make money off Gemulator sales?

And it wouuldn't be the only Mac emulator in the PC world. Executor (a program for NeXTSTEP which emulates a Mac) now has a NeXTSTEP Intel and a DOS version. But it is a little more expensive..last time I checked it was $800 but that's close to the price of Gemulator and Spectre (together) and think the price has dropped since then.

All in all, Dave might be making a big mistake....but I don't think he's in it for only the $$$. I seem to remember that Apple wanted to buy part of the Spectre code off him (it ran better than the Apple orginal) and he wouldn't sell to them.

From: marc@targon.UUCP
Message-ID: <3533@targon.UUCP>
Source record: 37233

After having been hit several times by bus- and address errors
at exit() calls in programs compiled by Turbo C 2.0, I decided
to have a closer look at what is going on in that exit() call.
It shows that all opened files are being closed, and FILE structures
are freed for those files with the 3rd bit of the Flags
member set. The crashes occur when the file structure of _StdErr
(Handle -1) is freed. The 3rd bit of 'Flags' seems to be set for both
regular files and _StdIn, _StdOut and StdErr, while bit 4 is only set
for regular files. The problem had gone when I replaced the check
on the third bit with a test on the fourth bit.
Has anyone else ever had this problem, and is it in some way harmful
not to free those special file handles?

Date: 1993-08-17 16:03:33 UTC
From: odonnllb@vax1.tcd.ie
Message-ID: <1993Aug17.160333.1@vax1.tcd.ie>
Source record: 37232

Is there an easy way of getting rid of the bad sector list on an SM025?
This is not for reclocking the mileometer, or just making me feel good,
though it would do that, but because the bad sector list refers to the
ST225 drive that used to be in it, and not the RO3055 it now holds.
I am nervous about HDX or myself getting confused if (when) the RO3055
needs reformatting: how will we be able to tell a real bad sector from
a piece of history?
Any help will be appreciated. E-mail preferred as the local IBM/Mac
asylum doesn't hold articles in this newsgroup very long.

```
**********************************
*** Atari MegaSTe 4/50 for sale ***
**********************************

16MHz 68000 cpu
4Mb RAM
50Mb internal hard disk drive
one 3.5 inch internal floppy drive
one 3.5 inch external floppy drive
separate programmable keyboard
VME expansion port
SC1224 color monitor
SM124 mono monitor
mouse and all cables, manuals, etc.
200+ disks of PD/shareware software w/storage boxes
Plus some commercial software (email for info)

Got to make room for some new hardware and in order to maintain marital
bliss, at least one of my Atari computer systems _has_ to go.

Overall, this system has proven to be very reliable and it provides a
considerable performance increase over a standard 8MHz STe. In many ways,
I find it preferable to the Falcon030... it's nearly as fast, easier to
expand, much more compatible with existing software and has an excellent
keyboard (all IMHO, of course).

I will consider all serious and reasonable offers. Payment can be
arranged a number of ways to include cashiers check, money order, cash
COD, or even M/C or Visa if you prefer.

If interested, forward your questions and/or reasonable offers to me
via email at hutch@ilmen.lanl.gov and I will get back to you. Or you may
phone me at (505)665-3665 (days) or (505)662-7236 (evenings), MST.

Thanks,

>change?

Well, I think that if sheppard_r@. . . wants to try to say that the
ST is no good because it doesnt have C-Kermit 189, he is a fool (and
should go to the advocacy group anyhow - this is a serious newsgroup)

However, 189 is MUCH improved over 188. True, thre version change
number is small, but 189 allows a faster connection when both sides are
using 189. The fast mode is FASTER THAN Z-MODEM. (Yes, faster than
Z-Modem). As you probably know, 188 is as slow as all older kermit
versions. (i.e. very damn slow. About have x-modems speed it seems
without actually timing it).

But, I am sure I could download the source for 189 and compile it for
an ST.

>

Tos older than 1.4 supports 16 MB partitions. Tos 1.4 and newer
support 32 MB partitions. (I am not sure if 2.06 and newer allow
larger). You can format the drive up to 256MB partitions with ICDs
software, but it will not be readable from TOS. (I think Neodesk might
read it. I will check).

Why? There would be almost ZERO applications that you could use
the joystick with anyway, so I don't see why Darek would try to
support it (except to made it look better in advertisements).

Also, the idea with GEMulator is that you use the PC's hardware:
harddrive, sound, video, mouse. But PC joysticks are not Atari-style
ones, so that would all require additional hardware.

4240. GCC 2.4.2

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-18 05:25:20 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CBxwE8.J2p@sdf.lonestar.org>
Source record: 37099
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm interested in learning Objective C, and I just got the new 2.4.2 version of GCC, but it seems to only have the basic compiler in the archive and not the c++ or objective C compiler. Objective C is also supposed to come with an interpretter - one of the many reasons why I want this beast!! I did not see an interpretter in the archive,

I got the mgcc242b.zoo archive from the MiNT section. Where do i get the things that I need? Should I get the larger (> 1MB which is gonna be hard to get with BART!!) archive in the GCC section for TOS? Will this archive have the things I want? Its exactly the same I think (same version number!!!). Will I be able to mix-n-match the base-relative parts of the compiler from the MiNT directory with the non-base-relative peices from the TOS archive??

Does the Objective C interpretter even exist for GCC? Can it be used for standard C? Also, where can I get the Objective C specific libraries?

Has anyone created any sort of Objective GEM Library?? Something like MacAPP or the NeXT Interface Builder would be nice. Hehe .. maybe we can talk Ian Lepore into porting GEMFAST to be an object library :-)

Please E-Mail responses. I don't know when I'll get back on the net again. Thanks a bunch!!

>are they compatible with anything else?

I believe these are a special Lattice format as are the .OBJs, which might be the same as the Amiga version of Lattice C, but little else.

With my version of Lattice C there was a Lattice -> GST converter and a GST Linker. A GST -> Lattice converter would be more useful and might be included in the latest version. Even if Pure C doesn't use GST format, it probably supports it in some way because it used to be standard.

I believe Devpac V3 will produce Lattice .OBJs.

>So THAT is the problem! I found for a fact that my assembly programs would not
>run reliably with less than about 4k of stack space, above and beyond my own
>requirements, but I couldn't find out why. Thanks for clearing that up.

I did mention it here a while back.

I had a desktop accessory that randomly crashed with a stack overflow, however I knew that I wasn't using too much stack so I didn't believe it, and sure enough closer investigation showed that in fact the "bottom of stack" variable (used at the beginning of every function in the program to check that the stack hasn't underflowed) was being corrupted, trigger a false error.

However, I couldn't work out why. By expremention I found that if I removed all my GEMDOS calls everything worked fine. I replaced these with BIOS calls and it started crashing again, but far less often.

I eventually gave up, but I was still worrying about the problem and it was only later when looking at a BIOS disassembly that I realised that when you call the BIOS in user-mode the first thing it does it set the supervisor stack pointer to the user stack pointer. This makes getting the arguments from the stack slightly easier, but means that the BIOS function and any interrupts which occur during it will use the program's stack.

Needless to say this is incredibly stupid, as one of the reasons for having a separate supervisor stack is so that the programmer doesn't have to guess how much stack the OS needs. I speculated at the time that the VDI and AES which don't take arguments on the stack don't suffer from this behaviour, and that in later versions of TOS GEMDOS, BIOS and XBIOS might not either - causing serious compatability problems for new programs on old machines.

So what was actually happening is that the stack was overflowing within the OS call over the bottom-of-stack pointer. This was then triggering an stack-overflow error the next time my program called another function.

Since my accessory crashed much more when GEMDOS was used rather than BIOS, it seemed that frequency of crashes was proportional to the time spend with a

screwed SSP. This lead me to suspect that an interrupt was actually causing the stack overflow.

It was some time back now, so I'm sorry if I got any details wrong.

>software, but it will not be readable from TOS. (I think Neodesk might
>read it. I will check).

Wrong. Totally wrong.

The GEMDOS in TOS 1.00 and TOS 1.02 supports up to 32768 logical sectors. With 512 bytes per sector, you get 16MB. Newer GEMDOS versions seem to allow ~ 65536 logical sectors, so you get 32 MB.

AHDI and HDX support other logical sector sizes (starting with AHDI/HDX version 3.x). This gives you 256MB even on old TOS versions and 512MB with newer TOS versions.

You shouldn't use ICD's software for partitioning, because their format isn't AHDI compatible when using more than 4 partitions. This is not a TOS question, but a harddisk driver question.

Neodesk is a shell and has nothing to do which such low level disk organization questions.

J>Question: does this Mega keyboard "hack" work only with the old Mega
J>keyboards, the Mega STe keyboards, or both?
Don't know.
But: I heard a rumour, that said there would be another Keyboard-processor in
the MegaSTE-board?
A remarkable difference between Mega ST and Mega STE is this one:
If You don't have a keyboard plugged into the plug of the Mega ST the computer
won't boot (if You don't have a small fixer installed - instruction to do this
can be received from me too!).

Bye

The AES saves its context on the user stack, hence the machine rapidly gets hosed if you call the AES from supervisor mode. 4K has to be a good amount to use tho'.

GST->anything is all but impossible, you can literally do anything using the
GST object file format, which whilst its infinitely general is dog slow to
parse and a bitch to work with. The next LC release does include a DRI to
LC convertor tho. The formats (GST, LC & DRI) are now documented in a book
we (HiSoft that is) have been working on for a while; its not back from the
printer's yet but it should be around any day soon.

Not quite, Macs used DB-25 cables, not the "DB-50" that Suns used. Workstation suppliers like Andataco, R-Squared, and the like will have these cables in stock. Other electronics stores might have them as well.

The internal 50-pin ribbon connector is pretty much the same on all devices. If your cable and connectors aren't keyed, you might have plugged it in upside down, which would be a major drag. (Can you say "25 short circuits" ? ....) Your cable and the connector should both have a triangular arrow to denote pin 1, make sure these are lined up when you plug in.

I've never had any trouble with communicating with SCSI devices due to problems with termination. (I've had 0 terminators, 1, 2, 3, 4 all on the same bus, with no observable effect.) Since the Sun drive came in a case with 2 external connectors though, it was obviously meant for daisy-chaining and will most likely not have any on-board termination.

The only other point is what Brian already said - make sure parity is disabled on the drive.

Nope, Sun-3/50s did not support synchronous SCSI. Sun only started supporting
that in their newer controllers, after the Sun-4 was introduced.
>
>All this can usually be selected by jumpers, but you need the documentation of
>the drive to do it. In any case You really should check these points.

Yes, parity is the #1 cause of problems in configuring SCSI systems, it seems.

Just a footnote on one of the other points - ST-Minix has had SCSI support
since day 1. It's the Amiga port that was(? still is?) lacking a SCSI driver.
I'd guess the Mac-Minix lacks it as well, since Mac-Minix doesn't talk
directly to hardware anyway.

Don't panic - on old style Atari drives, the bad sector list is maintained on
the drive itself, the controller board being completely stupid.
TOS has to walk around them by software, just like on a mine field.

Modern SCSI drives hide their bad sectors from the system, locating them when
formatting and skipping them automatically when in use.

To all Quantunm LPS240S Users/Owners,

I just formatted my new Quantum hard disk and divided it into 9 partitions.

C:\ 10 MB
D:\ 32 MB
E:\ 32 MB
F:\ 32 MB
G:\ 32 MB
H:\ 32 MB
I:\ 32 MB
J:\ 32 MB
K:\ 11 MB

When I checked my hard drive's performance I got 18 ms average seek time. If I am right, this value should be more like 8 ms, right? Can someone tell me what is the best value for the interleave, what parameters you have your drive formatted with and finally what are the best utilities to use with Quantum drives?

Woj. (wojci_g@pavo.concordia.ca)

>Glendale, California show (18-19 Sep). Definitely worth checking out.

Well I am sorry but I have to make some comments on the overly
commercial material presented here.

>Gemulator 3.0 will be released on September 18th 1993, at the Glendale
>Atari Show in Glendale California. The price remains at $229 U.S. complete

A Falconspeed costs not much more so that would make something to
compare a PC with Gemulator with.

>Gemulator 3.0 also adds these enhancements not found on your standard ST:

> - 640x480 color graphics (with any VGA card)
> - 800x600 color graphics (Video7, ATI, Tseng, or VESA SuperVGA card)

Hey with a card any ST can do better than its standard Graphics.

> - maximum ST memory is 8 megabytes, double the limit of an ST

ST's can now be expanded to 12 meg.

> - 1.44 meg high density floppy disks are supported

Yes TOS 2.06 does that. Also for ST's (will need 16 Mhz clock for
controller)

> - support for multiple TOS ROMs

There are also TOS switcher cards for ST's.

To sum it up:
Gemulator is an impressive product if you have a high end PC, but it
does not offer things an ST cannot be made to do.

Erlend.

In fact ist not a *bug* but a feature. You need new libraries, MiNTLib pl34 should be fine. Gcc-2.4.x just needs a __main in the lib. ;-)

Cheers, Thomas

This is not a bug in gcc 2.4.4, but the effect of an outdated library.
Get the latest MiNTlib, and everything will work.

Please tell my why you did not use BGM Partitions, say 80megs etc,
Your sreen must be filled up with Drive Icons..??

Ataries HDX and ICD stuff lets you have Big Drives, no need for all these
drive partitions....

I have just installed 2 Qantum LPS 240S drives and just used 4 Partitions,

The first one being 5 megs and the other 3 just 80 megs..

ICD do sugqest a small 'C' partition as that is the one that gets stuffed
the most, if fact that is now a default when Formating with the new
ICD Formater, you have to hold the 'Alt' key to over ride this...

There is no need for Interleave with the Atari as the computer is fast enough,
not like most of these slow PC clones..

I get 18 ms seek with RateHead, but Please note, this is a average and not a
Track to Track seek test, and my data rate is some 1200k...

I have also read some were that RateHead can't give a real Seek rate because of
the Caching used in the Hard Drive...

Roger..... sheppard_r@kosmos.wcc.govt.nz

On the subject of mint libraries.
What is in Mint libraries? Only function needed for programs to use Mint or are the funtcions useful without Mint too? And will programs compiled with the mintlibs still work under plain TOS?
Does a version of the mintlibs exist for Heat and Serve C? If not, will it be difficult to compile them from source? Are there many function calls that differ after the 7th character? Since H&S C 2.0 isn't out yet with up to 20 character significant function and variable names in the object files.
Does the mintlib replace other libs or is it an addition to the already existing libs?

Erlend.

Well, I don't know about online services in the UK but here in the US most commercial services have a surcharge for baud rates over 2400. You can buy 9600 baud modems quite inexpensively now with varying degrees of compression technologies to speed throughput. In order for these to work, of course, both modems on the line have to support the same rate and compression scheme.

Depending on what your telecommunication needs are, I still think the best deal for the average user is an inexpensive (app. $US50) 2400 baud unit. If you want/need more features (fax, 9600+, compression) you'll pay for it. But if you do a lot of long distance online calling, the higher throughput may save you money in the long run.

The MiNT libraries are complete library sets which can be used in parallel
with the standard TOS libraries or can replace them completely. Much of the
code in the MiNT libs is identical of very close to that in the TOS library.
It has additions to all you to use the extra functionality MiNT gives you
but only has a subset of the UNIXMODE code as this hack is not needed when
you use MiNT with the Minix filesystem.

Extras include things such as fork() and vfork(), Unix compatible exec*()
functions, functions for setting and getting process/user IDs, reading
password files and other config files, etc.

When the programs are run under TOS the libraries do their utmost to emulate
the MiNT functionality, though much is not emulatable.

>Does a version of the mintlibs exist for Heat and Serve C? If not, will

I think someone has worked upon both H&S C and Pure C versions of the
library.

>Does the mintlib replace other libs or is it an addition to the already
>existing libs?

As I said above, it can do either. The versions of GCC built for Mint
(though which can run under plain TOS) have an extra switch to allow the
selection of library.

>Erlend.

I myself no longer have any of the TOS libraries on my machine. I've found
that programs build using the MiNT libraries run as well under TOS as do
those built with the TOS libraries.

Your value is right. I also measure exactly 18ms, this is the random seek
rate. From one track to the next would be faster.

By the way I have 1941 K/s directly connected to the TT.
Why make so small partitions, I have only 4.

>On the subject of mint libraries.
>What is in Mint libraries? Only function needed for programs to use
>Mint or are the funtcions useful without Mint too?

The MiNTlibs are a replacement for your compiler's standard C library.
It contains all the standard library functions, lots of BSD- and SysV-
compatible routines, functions for dealing with MiNT, and other useful
routines like regular expression matching and command-line option
handling.

> And will programs
>compiled with the mintlibs still work under plain TOS?

Yep.

>Does a version of the mintlibs exist for Heat and Serve C?

I just recently uploaded the latest version to a.a; look for file
Mint/Lib/mnthlb34.zoo. This time I've only included the
1.40-compatible version of the library, since it seems silly to release
the 2.0-compatible version when 2.0 hasn't been released.

> Are there many function
>calls that differ after the 7th character?

Only two that I know of, and they're masked by #define's in the system
headers.

> Since H&S C 2.0 isn't out
>yet with up to 20 character significant function and variable names in
>the object files.

Has anyone heard from Ian recently?

>Does the mintlib replace other libs or is it an addition to the already
>existing libs?

It completely replaces the standard libaray; the HSC version also
replaces the math library.

You don't need gcc unless you want it (i.e. there are plenty of precompiled
binaries available). Simply ftp to atari.archive.umich.edu, cd to Gnustuff,
cd to Tos or Mint (depending on which OS you wish to use), and grab away.
The stuff is well indexed.

The short answer is no. You might be able to use the drive on the hard
card by removing it and cobbling together an Adaptec controller and an ST
host adaptor. However, it would not be worth the effort (nor would you save
any money, as you would have to purchase a SCSI controller).

Some drives seem to be worse than others; I just changed an HD on a Mac IIfx
and a TT030 in the office for Quantum LPS240Ss, neither HD would do anything
useful until I fixed the termination problems (up 'til 3 weeks ago I'd never
had any problems either). Up 'til that point both machines had lots of SCSI
devices hung off the back with totally screwed up termination.

At a guess that's with ICD's RATEHD; don't take what it tells you too
seriously. It may be that thats the average seek time and that the data
rate is 'only' around 1.7M/s, but in my experience the LPS240 feels faster
than 'faster' drives (e.g. the Seagate 3283N which RATEHD gives 13ms and
1.9M/s).

K>>If the text appeared in the window, you were lucky. VDI doesn't know
K>>about windows. What you should do is open a "virtual workstation" for
K>>each window, and use the virtual workstation associated with each
K>>window for drawing.
K>While this is probably feasible, I don't see a need to open a
K>virtual workstation for every window. This may be appropriate if
K>different graphics are to be displayed in different windows,
K>requiring different drawing styles. But for displaying different
K>texts, it may be sufficient to use a single virtual screen
K>workstation and a record containing info on the xywh coordinates of
K>the workspace of each window, and the internal positions of the
K>stuff displayed in the window.

If you probably will build in different font selections for every window
later on, it is an investment in the future, to handle one virtual
workstation for every window today.

This means also, to handle the actual font size, font id and text effects
separately (in an array of course). This really shouldn't be a big
problem, and if you have a look at the Universal Font Selector (UFS), you
will hopefully implement a GDOS support very soon.

My JRI with SIMMS to four meg has been solid as a rock from Day 1. I did, however, take John Russell's advice and snipped out all the old RAM chips from the one-meg memory system (I mean with a wire snipper). They eat up juice if you leave them all (think there's one left at a connection point, but the instruction sheets tells that). Also: I recall that we had a bit of a hangup when we first turned on the machine ... but a call to John turned up the unmentioned need to keep the grounding wires as sho
rt as possible (we had run out about six or eight inches, and John said it had to be down to TWO).

Best regards from Indiana...

Check with Paul Purdom at the Indiana University Department of Computer Sciences. like to be ppurdom or just purdom @indiana.edu assuming you have Internet access. He's an Atari guy and has all the books to teach 68000 Assembly ...

4278. Setting window colours from application?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-19 23:24:59 UTC
From: warwick@cs.uq.oz.au
Message-ID: <14996@uqcspe.cs.uq.oz.au>
Source record: 37124

With the newer TOS versions, the window components can be set to have
different colours.

Can this be done by the application owning the window? (eg. with a
wind_set call or such).

(I'd like GEM NH to set the colours of the window components, since it
has it's own palette).

LH> wrong.

Well, everything you say certainly jibes with my experience on TOS 2. 06 on my MegaE. I found that my code would mysteriously crash when I ran it, but at seemingly random points. As an experiment, I tried running the program in a loop from my debugger, using a data register to keep track of how many iterations the program would run, and the loop count varied widely.

I AM curious as to why Atari chose to use the user stack for exception processing, but I am REALLY curious why they never told anyone so that we would know. I'm not particularly woried that it uses my stack, I'd just like to know how much of my stack the OS needs so that I can figure out my stack allocation needs. I'm quite certain that this 'trial and error' approach to stack allocation is responsible for a number of software problems out there in the big ol' bad world.

WA> harddrive, sound, video, mouse. But PC joysticks are not Atari-
WA> style ones, so that would all require additional hardware.

I don't see why it would be difficult to support Atari style joysticks with the PC ones. The PC sticks are linear pots as I recall, so just pick a threshold value. Anything above that value gets sent as a '1' for the Atari joystick, and anything below it gets sent as a '0'.

I do agree that there would be little use for it though. You can get lots better games on the PC.

Source record: 37054

Hi! Remember me?

Due to a feedback coursed by my hint (hi John!) that I have a fix to make
ye olde Mega ST run without a keyboard plugged in I'll post the
instruction to do this little thing:

Below there's another hardware-fix for user's without a printer ...

Again taken from ST-Computer 10/90 page 162:

========
If you remove the keyboard from the Mega ST and switch on the computer,
the computer won't boot up and send you a series of 'Alert-Beeps'.
If YOU want to let your Mega ST run without a keyboard (FAX-Server a.s.o.)
simply connect a restistor to the keyboard-plug in the Meg and at once
there's silence and he'll do his job!
(Freely translated from Eickmann-Computer by me)

```
6 * 10kï¿½ resistor
5 * _____
4 *----|_____|--
3 * |
2 *-------------+
1 *-------------|
```

Mega ST keyboard-plug
(inside-view)

==========

And here's another one:

Do you hate it - after pressing <Alternate>+<Help> the same time - when
you don't have a printer connected to the parallel port of your ST and
must wait a long time to work again because of the long break taking the
computer to realize that there's no printer connected?
Well, do this and forget about it:

connect the following pins of the printer port of your computer (better:
create a Sub-D 25pin-male-plug an connect the pins on the soldering side):

pin 13 connected to 14 and 15 (all across the plug)
pin 1 connected to 10
pin 23 connected to 11 and 12

That's it, ALMOST of course:

If you try these fixes and crash anything (your computer, your solder
your wife, your husband or others) don't blame me :-)

Bye
Stefan

>
>Suggestions?

I don't know how SCSI works exactly, but it wouldn't suprise me if your CD-ROM drive was designed with PCs in mind. Since PC DMA doesn't work over segment boundaries the designers probably decided larger transfers were not worth supporting.

We've already had floptical disk drives that can't read/write sector 0 of normal 3.5" disks since the PC doesn't need to be able to. This stops them from accessing standard Mac HD, Arc or Amiga disks and they only work with ST disks because they are the same as PC ones.

In the UK, your best bet is to get a V32 or 32bis modem and get onto Mercury.

Personally I use Mercury and a V32bis modem (which you should be able to pick up for around 180GBP).. Mercury is much cheaper than Telecom for any long distance work.

>
>

This leads me to a question I was wondering about... I just recently did
a program that places text in a window to be scrolled, resized, etc...
and when the window has an info bar (on TOS 1.2) and i use wind_calc() or
wind_get() to figure out the work area for it, the work area OVERLAPS the
infobar at the top!

This seems to be a pretty major problem... I decided to look at what Eric Smith
I decided to get the toswin 1.4 source and look at what Eric Smith did
to avoid this problem and it looked like he used vqt_font_info on the
system font to determine the height of the info bar and stored that value
in a field for his window... and the same method works fine for me, but
this would seem to be a pretty major bug. Is this just my code or is it
TOS 1.2 or what?

Granted the ST can be upgraded to the same capabilities that the
Gemulator comes with, but you forgot to mention the costs. If you
buy a graphics card for your ST, you will probably need a new monitor.
To boost the memory (on a stock ST) you need to buy special hardware
and memory chips. To use a high density drive you'll need to purchase
a new drive. Don't forget that you'll need a hard drive controller and
drive if you want a hard drive.

In all these cases, a 'stock' PC has all the necessary hardware at a lot
cheaper price. Don't get the wrong idea, I'm not saying that the GEMulator
is or should be a replacement for an original ST. However, in my case, the
GEMulator has allowed me to complement my 1040ST and continue to use some
of the more hard drive intensive software without much more expense.

>_____________________________ John "HUTCH" Hutchinson ____________________________

Well, I don't pay for online services, since I have many good local
BBS', and of course, these news groups and the umich archive. Sometimes I
will call long distance for something, but not very often.

I just heard that, the modem that I have, the Supra Fax Modem v.32bis, that's
like 14K baud +, is selling for $179 (sysop price - $150). Last fall these
were selling for ~ $279 to $300.

With my old 2400 baud Supra I never got over 200 cps when downloading
or uploading. With my new Supra at 9600 baud I consistenly get 1100
cps. At 14K baud - something like 1700 cps. These times are for
compressed binary files. How does 2000 to 3000 cps for ascii text files
sound? For example, if a large file took me 45 minutes to download
with the 2400 baud modem, it would take only ~ 5 minutes to download
now. Side point: As far as I'm concerned, any BBS that's not over 2400
baud is old hat.

Something else... If you need the modem fixed for some reason, Supra's
turnaround time is about two days for repair. So for me, from here,
that's two days more for next day air shipment time. Not too bad, I
would say.

CUL,
Chuck

4293. Help with Speedo Drivers

Hello all,

I just got a nice new laser printer [Okidata OL830+] and am having some problems getting proper printouts from Atarai Works V1.2. The printer is postscript and HP LaserJet II compatable. When I print a documnet sometimes [rarely] the printout is perfect, but most of the time in the middle of a line of text [say Times at 36 point] there is a buch of regular ascii [default printer] characters mixing with the bit image text that Speedo Gdos was sending to the printer. It seems that the byte stream of pixel data is sometimes being corrupted. I am using a shieled printer cable.

I know the printer works fine since it prints out long TeX documents fine using both the dvi_lj2.ttp and dvi_ps.ttp drivers that I have. both of these programs send as much data to the printer as Speedo-GDOS does but theyt work fine. I also printed out large postscript pictures with no problem.

I should mention that I tried the SPeedo laserjet driver with both Atari Works and with Wordflair II, with the same poor results. Any help would be much appreciated! It is a shame to have such a great printer and have Speedo crap out like its doing.

Cheers,
Scott Kolodzieski

Ok, if you want to talk cost, let's make something clear first - who is the targeted customer for this GEMulator product? Obviously, someone who has a lot of money already invested in ST software. Such a person is also likely to have a substantial amount of money already invested in ST hardware. Is it likely that this person is now going to shell out bucks to invest in a complete PC system, and then also purchase a GEMulator, just to be able to run a fraction of the ST software on it?

For most ST users, the cost to be able to use GEMulator has a floor of $500 to $1000, to obtain a usable 386-based PC system. Who knows what kind of video and disk controller cards you'll get in such a machine, what kind of memory size, etc... On the other hand, the raw components are the same, and cost the same. Why buy a PC with 8MB of RAM, when you could simply put 8MB into your ST? (In particular, why buy a PC with 8MB of RAM when most applications still only use 640K; the extended RAM can only be used as virtual disk, file cache, and swap, most of the time. Not that an 8 MB disk cache is bad, mind you, but it *is* a little silly when you really want to be using a large program on a large data set...) If you want a high density floppy drive, it costs the same to buy the mechanism, whether you install it in a PC or an ST. If you buy a PC disk controller, it typically will only handle 1 or 2 each of floppy and

hard drives, whereas a SCSI host adapter for an ST will allow you to connect 8 SCSI devices. Sure, you can buy a SCSI controller for a PC, but it's much more expensive, less compatible, and much slower than an ST, unless it's a Localbus card, but the cost and compatibility problems are magnified then. The argument that a stock PC has equivalent hardware at a cheaper price is just flat wrong - it may have the same hardware, at the *same* price, and still in some cases, the ST will be cheaper to upgrade.

Hey yall I am curios if anyone else has this problem. I have a 4meg mega/STe w 68882 FPU and using Speedo gives me probs.. The two probs being that I cannot
configure my printer drivers or build width tables. when I goto those menus it does the bee like normal then the arrow comes back and the machine locks minus mouse movement... I do not know what versions I have, but the disks have Rev A stamped on them...

When I get new fonts or build new width tables I detach my HDD and attach it to another Mega E here at the house... But I have removed the FPU, PAL and replaced the jumper andi t works fine so I know its the FPU...

Cookie jar shows it as $00010000. And SysInfo shows it as a SFP004 or compatible...
Could it be I have the wrong PAL? I got it from a Atari dealer so I doubt it...

wonder what the chances are of atari updating those ACCs... :)

thanx!

-Kevin Fason

Anyone out there who knows a lot about changing videomodes on the Falcon, using the hardware registers directly?

I have a problem ... I'm trying to get to 320*480*65536, and I've gotten all the sync rights etc, but the screen looks kinda "garbled" .. I'll try to explain how ..

The first 40 (ca) pixels on each line are OK, then there's a 40 pixel wide field where with white and black vertical stripes, then there's a 40 pixel wide OK field again, and then the black/white field comes back ..
(This repeats on all lines, making up a screen of good and bad vertical stripes)

I can set the colour of the pixels in the "Ok" areas, but not in the black/white fields ...

This is how I do it: (Assembler)

```
move.w #$140,$ff8210
move.w #$186,$ff82c2
move.w #$4,$ff82c0
move.b #$0,$ff8260
move.w #$100,$ff8266 ; Set True Colour

move.w #$c6,$ff8282 ; HHT
move.w #$8d,$ff8284 ; HBB
move.w #$15,$ff8286 ; HBE
move.w #$2ac,$ff8288 ; HDB
move.w #$91,$ff828a ; HDE
move.w #$96,$ff828c ; HSS
move.w #$0,$ff828e ; HFS
move.w #$0,$ff8290 ; HEE

move.w #$419,$ff82a2 ; VFT
move.w #$3ff,$ff82a4 ; VBB
move.w #$3f,$ff82a6 ; VBE
move.w #$3f,$ff82a8 ; VDB
move.w #$3ff,$ff828a ; VDE
move.w #$415,$ff828c ; VSS
```

To get these values I used the Desktop, switched to 320*480 true colour, then I ran the VIDEO.PRG that comes with the FS5 archive ... I'm not sure which hardware registers he means with "Vmode" and "Shift", but I think it's $ff82c0 and $ff8260 ... (debugged the program and it looked like those two)

..pleeze ... I'm trying to convince a few of my Amiga friends to start programming on the Falcon instead, and so far it seems like I may succeed, but

I REALLY need to know how to do this .... :-/ ...

I do NOT need info on how to get to this video mode using system calls!

(Though I would like some Email contacts that are doing demos/games/fx's on the Falcon ... It seems that one can make VERY spectacular effects tweaking the Falcon hardware! .. <remembering the good old days of hardware scrolling on the ST .. "sync scrolling" etc .. ;-)>)

I see 2 arguments against this. The first, and simplest, is that
Darrek has been marketting this now for over a year, and is still going,
so I would assume he's making some money from it, thus proving there is
a market.
The market, I would guess, are those who, as Howard says, have a
substantial investment in ST software. Considerably more than the cost
of a Gemulator. These people would also have to have decided that their
future needs would no longer be served by Atari, and they've decided the
PC platform is the one offering the best future for their needs. If the
replacement cost of their current software is more than the cost of a
gemulator, then it makes sense to ease the transition, as the resale
value of Atari software is in my experience so rediculously low as to be
negligable.

4301. I have Multitos... and a few questions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-21 01:55:28 UTC
From: pelletier@Nyongwa.CAM.ORG
Message-ID: <CC36oH.5D0@Nyongwa.CAM.ORG>
Source record: 37055

Hello folks,

I have used Multitos on my TT for a couple of days now; I have
had a few problems with incompatible apps, but most of the problems
have been solvable (mostly by using chprot.app).

My biggest diapointment has been with the near-absence of documentation
that came with the package. Come on, Atari! Give your technically
enclined users a break! If printing the docs is too expensive, well
post it on GEnie or something. I'm not a programmer, but I like to know
what makes my system tick. Eric, how about uploading some tips about
Multitos? (Config files, etc.)

I managed to get Warp9 running, by changing its memory protection mode
(using chprot.app) and by placing it *after* mint.prg in the auto folder.
I don't know how stable that's going to be, I've had the system running
that way for only an hour so far. Screen speed has improved to more
tolerable levels, though.

The MiNT utilities I got on the net are working fine. This leads me to ask
about priorities in Multitos. When I run "top", all the tasks appear to
have the same priority. I know how to change an application's priority,
but does anyone know whether it's worth doing? For instance, I'd like
to quicken text display in Stalker under Multitos; could it be done
by "renicing" Stalker and/or system processes?

One last question: is there any way to get the latest MiNT binary,
short of compiling it myself? The Multitos manual promises that
upgrades will be made available in the future, but it sure would
be nice to be able to just go and get it.

Happy MiNTing!

Yves

>infobar at the top!

I think you must either be calling wind_calc() or wind_get() incorrectly,
or else the compiler/library you're using is buggy. I've never seen
any such problems with either function, and I used them exclusively in
TOSWIN/MINIWIN.

>I decided to get the toswin 1.4 source and look at what Eric Smith did
>to avoid this problem and it looked like he used vqt_font_info on the
>system font to determine the height of the info bar and stored that value

Nope, that isn't what I did. I got the system font height only so that
TOSWIN could default to that font & size if no configuration file is
found. All the window size calculations (see the file textwin.c) use
wind_calc and wind_get.

The easiest way for the work area to overlap the info bar is for you to
forget a window part in the mask you pass to wind_calc -- you might
want to check for that.

Well, he surely has made *some* money on it, but I wonder how many units
have actually been sold? I believe Darek earns his bread 'n butter working
for MS. He's not doing the GEMulator for a living... it appears to be
icing on the cake for him.

Also, the product itself is marketed by Purple Mountain Computers, right? I
believe they are also a computer dealer above and beyond the sale of the
GEMulator, so likewise, they wouldn't absorb a massive loss of income if
no GEMulators got sold at all.

So I think the product may persist partially because the company(ies?) backing
it can afford to lay this product at the feet of the masses and see who
snarfs it up. :)

<and to be clear about it, i think this is best way for ANY company to function
in a market as small as Atari's.. much less in the market of ex-Atarians who
go PC...>

[stuff deleted about the ridiculous low resale prices of used STs]

That really does bug me at times... my Mega ST 2 w/16mhz accelerator is
probably worth very little so I'll probably wind up keeping it whenever
I get my PC/Falcon/or both.

But really, this happens on every platform...the CPU dwindles in cost as
newer ones come out, but peripherals tend to decline in market value at
a slower rate. (with the exception of MAYBE hard drives!)

4305. Dialup access?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-21 06:17:20 UTC

I'd like to have dialup access to the files on my ST when I'm away from the house, e.g. browse text files from work or transfer GIF files, etc.

I've considered BBS software, but it seems like overkill; I'll do it if have to, but is there a simpler way? Can I dial in and run some kind of CLI perhaps, with XMODEM capabilities?

Anyway, recommendations for general approaches using TOS are invited; please E-mail, and I'll post a summary (there's enough traffic here!).

Oh, and recommendations for decent PD or shareware BBS systems are welcome, especially if I can freely access all disk volumes; ease of configuration is a highly desirable feature as well.

And one more thing-- I can't read German :-)

I think you don't use the actual MiNT Libraries PL 34.

>This is a bug in the gcc 2.4.4 not in MiNT. Get another version. I am
>using 2.3.3 and everything works fine.

No. I'm using gcc 2.4.4 with MiNT Libs PL 34 and everything works fine.

BTW: You don't need to compile genmagic.ttp oder asmtrans.ttp. Just
comment it out in the makefile. The binaries are included in the
source-distribution.

>As soon as the logical limit of 32 megabytes is exceeded, TOS starts to use
>more sectors per cluster but always in integer multiples of 2, ie; 2,4,6,8.

TOS uses always 2 sectors per cluster. If you want to use partitions of
more than 32 MB, TOS uses larger logical sectors (1, 2, 4 or 8 KB).

If you use HDX for partitioning you'll get 1K/sector with a 16 MB
partition and 2K/sector with a 32 MB partition, because HDX still
partitions TOS 1.00 compatible and the limit of logical sectors is less
than 32768 (Profibuch says 32766).

Other partitioning software (e.g. SCSI-Tool, ICDFMT, etc.) do a very
good job in not wasting disk space with too large logical sectors.

Bye,
Knarf

4309. New GCC versions for the ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-21 19:43:31 UTC
From: sourada@iastate.edu
Message-ID: <sourada.745962211@vincent1.iastate.edu>
Source record: 37059

Is it safe with the newer versions of GCC to use an older version of the ST sources and apply the newer general diffs? I assume this because the stuff that had to be changed for the Atari probably is not affected by current FSF changes to GCC...

If it's not safe to do that, where can I get the latest ST diffs? I've seen binaries for 2.4.4 (which isn't _quite_ the latest, but...) but I haven't seen diffs newer than about 2.3.3 or so...

Later,
Steven Ourada

I have been told that Quantum, uh, ``selected'' a nonstandard method for
determining seek time on their most recent drives. Just a coincidence, I'm
sure, but I'm also told their method of measuring seek rate gives their
drives better sounding numbers than the old, _usual_ method everybody else
uses. (Corrections, anyone?)

4314. Atari UUCP

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-22 00:34:48 UTC
From: Paul_Tuijnman@p2123.f130.n500.z2.fidonet
Message-ID: <2c76bf77@p2123.f130.n500.z2.fidonet>
Source record: 37067

Hi Martin,

Here's a transcript of an e-mail I sent today. I'm posting it here, hoping you or some other kind soul could help me with it. Today I received Hermes 1.1x and I think it's a shame i can't use it because of a tiny but (for me) essential shortcoming in UUCICO. Well, here it is:

Msg #113 / 1-116 Time: 21 Aug 93 16:41:04
From: Paul Tuijnman on 2:500/130.2123
To : lp@shlink.hanse.de on 2:281/202.33
Subj: Problem with UUCICO
---------[FIDONETMAIL]--
.MSGID: 2:500/130.2123 2c76424c
.PID: LED 1.22
To whom it may concern,

Currently I am using the Internet/Usenet facilities by means of a Fido>UUCP gate, but for five or six weeks now I'm also trying to get Atari UUCP to work.
First I found an ancient version of Mercury and a little later I tried my luck with Hermes (1.04). Right now I'm waiting for Hermes 1.10 to arrive and today UUCICO 3.73 came in. Still I didn't succeed in logging on to my host *once* and I'm getting a little discouraged.

My host runs UNIX on a 25 mhz NeXt and is a BBS and a Fidonet host as well. This also accounts for the problem I'm having (and apparentely quite a few other users along with me): my host's system needs to be called 'mailer' (in order not to end up in the BBS section as a user) and 'U' (in order to initiate a UUCP mail session) BEFORE the actual |ogin:| and |ssword:| fields in (X)HOSTS. No matter what I have tried it appears that UUCICO can't handle more than the THREE initial fields (login, password and spooldir), whereas my host's systems does need FIVE..

I contacted my host about this and he informs me other systems than Atari seem to cope with this without any problem. I also sent him the listings of the Mercury UUCICO and in his view it shouldn't be too hard to adapt it.

I tried polling with the latest UUCICO update with all sorts of HOSTS files and tried to apply '\n' and '\' where I could (to squeeze the contents of five fields into three), but I'm plain stuck with the fact that it does not correctly handle more than three fields. So, either I have to find a straight-on Unix site or I'll have to abandon the project altogether (which isn't really what I have in mind).

I'd therefore kindly ask you for some help. Is it possible to add this feature to UUCICO? If not, is there some other way of getting around this?

Any help and/or advice will be appreciated; thanks in advance and
good luck!

Paul

Are you sure you are *using* the MiNT Libs 34, or are you only sure
you have them?

I had to add the -mint option to the CFLAGS and change the
liraray define in the Makefile to a MiNT Lib instead of GNU Lib.
But still GENMAGIC wants to use GNU.OLB, not MINT.OLB!?
I had to link the MINT.OLB to GNU.OLB (and MINT16.OLB to GNU16.OLB)
to compile genmagic and amstrans.

4318. Telecommunications Help...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-22 21:45:56 UTC
From: bhtran@OCF.Berkeley.EDU
Message-ID: <258pek$ml9@agate.berkeley.edu>
Source record: 37069

Hi, I recently acquired a Supra FAX Modem(v.32 bis). I am having two
problems with using the modem with my Atari 1040STf:

(1) When I connect with another high speed modem (at 14.4K baud), I cannot set
my term to the proper baud rate because of my telecommunication programs
(Interlink and Uniterm; which do allow connections at 9600 and 19.2K, but
not 14.4K). Is there a terminal program for the ST that allows 14.4K (both
PD and commercial)?
(2) Also, my telecommunications program will not reduce the speed of the modem
on connection (it will always connect at the highest speed pssible).
For example: I set my term to 9600 baud and command the modem to dial
another high speed modem. The modem still connects at 14.4K regardless
of the speed I set it to. The same thing happens when I try to connect
at 1200 baud to a 2400 baud modem (just as another test). Are there
any settings to be made (software or hardware wise)? Are there any manual
"ATxx" modem commands that will fix this as well? Or will a different
terminal program fix both of the problems?

Please respond in e-mail to bhtran@ocf.berkeley.edu
Any and all suggestions/help will be greatly appreciated.

Bryan

I'm sorry! I know it's bad form to reply to my own post, but it seems
that I need to clarify something I said.

Let me first quote myself:

In article <CC36oH.5D0@Nyongwa.CAM.ORG> pelletier@Nyongwa.CAM.ORG (Yves Pelletier) writes:

>
>One last question: is there any way to get the latest MiNT binary,
>short of compiling it myself? The Multitos manual promises that
>upgrades will be made available in the future, but it sure would
>be nice to be able to just go and get it.
>

It appears that my question about MiNT binary upgrades availability
may have been too naively worded, because I got e-mail from a MiNT
beta-tester warning me not to "abuse" Eric's wishes with regards to
MiNT binary distribution. Well, I never have, and never will. Eric has
every right to dictate how is software is distributed.

Having said this, may I also point out that nowhere does it say that I
have to give up my personal right to bitch, whine, grovel and plead
about the aforementionned distribution policy. :)

In my humble and respectful opinion, Eric's decision to restrict binary
distribution is overcautious. Knowing, from his net.persona, that
Eric is a reasonable man, I understand that he must have his reasons
for this policy. But right now, it strikes me as rather arbitrary and
unfair measure. But, that's just me. Enough bitching and whining.

Now for the pleading and grovelling: Pllllleaaase! Eric! Whose kernels
are better than Orville Reddenbacher's! Whose breath is always MiNTy
fresh! If you're not going to change your mind about this, at least
consider allowing a reasonably recent binary to be uploaded *once in
a while*, so that your devoted Multitos and MiNT users may bask in the
glory of your ever-improving kernel. Amen.

I hope this clarifies my position. All I'm asking for is a convenient and
reasonably frequent upgrade path for MiNT users. I can't count on Atari
for that.

Regards

Yves

^^^^^^^^^^^^^^^^^^^^
OF COURSE, you should not use an array for this purpose.
You should have at least a record of some kind for each
window and obviously you'll put the information in here.
Also, the window records must be allocated dynamically,
because the user should be able to open as many windows as
s/he likes.

>BTW: You don't need to compile genmagic.ttp oder asmtrans.ttp. Just
>comment it out in the makefile. The binaries are included in the
>source-distribution.

It may have something to do with gcc 2.4.4. At least it appears to me to be
buggy.

The new init package (V1.1) has a note in the syslog directory stating that gcc
2.4.x is `terminally buggy', and I have indeed got nothing but illegal
instructions out of compiling syslogd with both mgcc 2.4.2 and a german version
of gcc 2.4.5. Also, trying to compile the latest version of GNU sed (2.16 or
something) yielded illegal instructions.

The bugs appears to be quite specific, though. I have recently compiled a bunch
of other stuff, and that *seems* to be running quite fine (well, most of the
stuff I use). So I guess that one shouldn't be surprised that most programs
compiles and runs fine, and some others just dont.

I have just grabbed mgcc 2.3.3, and will try it out tonight, to see if that
fixes things.

4323. Samples in GFA-Basic w/o DMA-hardware?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-23 09:37:20 UTC
From: gero@uni-paderborn.de
Message-ID: <25a34g$ea2@news.uni-paderborn.de>
Source record: 37076

Hallo together ...

I'm looking for the non-plus-ultra-routine for digitized sounds. I'd like to use samples as music and / or effects in a game written in GFA-BASIC V3.5. The sounds come from a PC with SoundBlaster Pro card, they come in raw format, mono, 8 bit. The game should be able to run on any ST (it's not important that the routine is OK for MultiTOS), due to this the sampling-rate won't be higher than about 8 kHz to let the machine just a bit of performance. ;-)

My idea was an assembler-routine stored in an INLINE. It should get the adress and the length of the sample as a C-style parameter or something like that. But now the impossible thing of this -- it should run in the background. The routine has to link into an interrupt (don't ask me how to do that), play the sound and then un-link itself. It should be so clever to react secure on a re-call when the former sound isn't finished yet. Perhaps stop playing and play the new one or ignore the 2nd call and finish the first call. -- If the routine detects DMA-hardware, it may use it, but that's not necessary.

Does a routine like this exist? Who can write or has written something like that? I know it must be possible -- I've got a demo that plays a sample at 9.5 kHz in the background, and in the foreground an animation is running. How come I know what is bg and what is fg? Because you can interrupt that programme with a debugger and the sound plays on.

Please send your reply to me by mail because I don't have enough time to read all the news very often.

Thank you ...

What kind of HD is it? I mean -- MFM, RLL, IDE (AT-bus), SCSI? SCSI is no problem, IDE a bit more, but I think on one of the last ATARI-fairs in Germany somebody built an IDE-hostadapter, the fact that the F030 uses an IDE-HD says enough.

I don't know any solution for MFM or RLL. It sounds possible that your 40 MB HD is an RLL, so you won't have any chance to use it further on in your ST.

4328. HOW?? MIDI rates from Serial Port ??

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-23 14:29:26 UTC
From: Carl E Lippitt <lippo@dasd.honeywell.com>
Message-ID: <1993Aug23.142926.8868@burro.dasd.honeywell.com>
Source record: 37082

I use Dr T's Omega sequencer software (highly recommended) and noted in their documentation that they support an additional MIDI data stream via the serial interface. Sure enough, if I tell it I have the proper do-dad hooked up the the serial port (they sell a small gizmo that changes the output to the standard current loop output of MIDI land, called the PHANTOM) MIDI looking data leaks out of the serial port.

I hook another terminal up to the port and watch the data on the terminal.

My problem: How to program the serial port to run at MIDI speed??

After reviewing the hardware specs, glancing thru the BIOS listing, and fumbling around one evening without advancing the art of hacking, I'm concluding that the fastest asynchronous serial protocol that the ST hardware can support is 19.2K baud. This is only half of the needed speed. So how does Dr T do the Phantom thing?

I suspect that there is a serial to serial converter in their little do-dad. Can any Phantom owners out there confirm or deny this?

Can some kind ST hack tell me if there is a way to push serial data out at the MIDI baud rate?

(If I had an extra $100 laying around I'd just buy the Phantom thing, but foiled obsessions soon turn into principles....)

Well, someone in my office suggested that the Sun drive needed a terminator, which my internal drive may have had built in. So I changed the device ID on my internal drive to #1 (couldn't figure out how to do it on the Sun) and hooked them up in parallel. And to my surprise it worked! I ran ICD's IDCHECK (I think that's it) and it told me what it was. Then I ran Atari's HDX formatting program and tried to format the beast. The lights came on and it started ticking away, and continued to tick away for about an hour and a half (I have no idea how long a drive like that should take to format). But I figured something was wrong, so I turned everything off and on again, only to find that I no longer got any response from the drive. I didn't change any of the connections, just booted it back up. What have I done? Is what I did really stupid (i.e., will this drive ever work again)? Any help?

-thanks

4332. Re: Mintlibs (Was Compiling MiNT...)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-23 21:13:00 UTC
From: mcookson@flute.calpoly.edu
Message-ID: <1993Aug23.211300.169885@zeus.calpoly.edu>
Source record: 37086

I compiled Mint 1.08 with GCC 2.4.4 and MintLib 34.

I did it without much thought. I just downloaded the Minlib and GCC binaries.

I had three problems:

(1) Running out of memory. I have 2.5MB. I had to disable everything and use sh instead of a better shell. (This was not really a problem). Also GCC is a memory hog. It might be a lot less memory intensive with a native ST compiler.

(2) I did not have bison. Supposedly the asmconv.ttp (I dont think that it the right name. But asm....ttp anyhow) must be compiled for specific processors. For somereason, I got errors trying to compile that program (if anyone knows why, let me know. It have me some error with ___main. It is a simple program. I figure it must be a MintLib problem). Anyhow, I used the exe. included in the download and that worked OK.

(3) I could not get the program to make the .i file to compile either. There was a .i file included, so i just used that, and it seemed to work. the program that is supposed to create the .i file would not compile.

In any case, with a slight modification of the makefile I got around those problems. I am using a 1040ST (8MHz). It took a few hours to compile (most of it unattended).

- mike

(And I dont know the differences yet. I assume it is more stable. Also it allows shared code.)

4333. Falcon audio input problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-23 22:15:53 UTC
From: oracle@iastate.edu
Message-ID: <oracle.746144153@pv0a27.vincent.iastate.edu>
Source record: 37087

I am having a small problem with my Falcon that perhaps someone could help me with, I'm not experienced at all when it comes to audio systems, so I don't really know what is causing my problem.

The problem seems to be with my left channel. I have been hooking my CD player to my Falcon by using a cable that converts from the CD's L and R RCA jacks to the Falcons 1/8" Stereo mini jack. I am also using a -40db attenuator on each channel as suggested by Atari. For some reason, when I try and sample from my stereo, the left channel is totally absent, however when I hook up two microphones using a L<>R splitter both channels work perfectly.

This is where it starts to get wierd. If I use a mono splitter on the left channel, and add a microphone, then the left channel comes through OK with the exception of the signal being a bit lower. If I turn the microphone off, the left channel again ceases to function.

This problem has only showed up recently, both channels used to work flawlessly. I would appreciate any suggestions that you other Falcon owners might have.

Thanks in advance.

>I had to link the MINT.OLB to GNU.OLB (and MINT16.OLB to GNU16.OLB)
>to compile genmagic and amstrans.

Ohoh, I think you didn't read the manpages. If you only have the MiNTlib
installed you can rename MINT.OLB to GNU.OLB and MINT16.OLB to GNU16.OLB.
Then GCC will use the MiNTlib without the flag -mint. You shouldn't
rename the files if you have the MiNTlib and the GNUlib installed.

4335. HP4ML/Centronics -> ST ?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-24 01:17:15 UTC
From: whitbeck@equinox.unr.edu
Message-ID: <1993Aug24.011715.1001@unlv.edu>
Source record: 37088

I want to connect an HP4ML printer to my atari STf.

It is my vague understanding that the HP4ML has both a
Centronics and an Apple-talk port and that it does Postscript
(Adobe).

Any comments on the veracity of the above?????

Has anyone connected this printer -or any printer with a
Centronics connector- to an ST? Care to share your experience?

The clerk in the store assured me the printer was postscript
but had no literature on it... that the cable was standard and
adaptor cables were commonly available but had no cables knew
not the pin-outs on the printer...

I really need postscript if I can get it!

Has anyone adapted an apple laserwriter 300 to the ST?
(Appletalk -> serial???).

If you can help me sort this out I'd appreciate E-mail!

Thanks in advance,
Mike Whitbeck
whitbeck@unr.edu

also many thanks to all who helped me sort out how to write text
to a scrollable window under GEM/VDI! It was right before my
eyes the whole time!

4336. Falcon Programming Anyone?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-24 02:04:52 UTC
From: oracle@iastate.edu
Message-ID: <oracle.746157892@vincent1.iastate.edu>
Source record: 37089

Hello all,

I am wondering if there are any Falcon owners out there who might be interested in a joint programming project. I have been using an ST for a long time now and have been programming 'text' type programs for a little while. Recently I have become interested in learning to program graphics and sound and seeing some of the Demos running on the Falcon has REALLY got me interested. The problem is that I don't really know where to start... The following is a list of areas that I would like to explore.

TSR's, Interupts, Basic Graphics Functions, The Cookie Jar, CPX's, etc.

Like I said, I don't really know where to start but I am thinking that a Screen Saver for the Falcon controlled by a CPX would be a great place to start. If there is anyone out there who would be interested in undertaking this task with me or anyone who would just like to share some of their vast knowledge with me it would be greatly appreciated. It could be fun!

PS, I have Lattice C 5.5 and that is what I would prefer to work in...

Thanks

Hi,
I am thinking of upgrading my 1040STE with a 68030+68881. As I am thinking of building this my self, I have some question that I hope someone can answer. Perhaps somebody who's already done it can give me some tip. Now for my questions:

1. Does TOS 2.06 work with the 68030?

2. Where does TT-ram start?

3. What's the pinlayout of the internal expansion port on the Mega ST?

Lennart Lindell email: epklell@kaepk.ericsson.se

C>I assumed (whcih makes an ass out of me :)) that it was placing the
C>text much as rasters are placed, oriented by the x1,y1 coordinate...

Not all all! It's a very logical assumption to make. One tip though, text alignement is controlled with VDI 39 and has several options. Vertical allignement is supposed to default to top line but I always change it as follows:

```
*
* set text alignement to bottom
*
move.w #39,control ;opcode for set alignement
move.w #0,control+2 ;number of PTSIN points
move.w #0,control+4 ;number of PTSOUT points
move.w #2,control+6 ;length of INTIN arrays
move.w #2,control+8 ;length of INTOUT arrays
move.w virhandle,control+12 ;device handle
move.w #0,intin ;horizontal: left justified
move.w #3,intin+2 ;vertical: bottom line justified
bsr vdi
```

Message-ID: <1993Aug24.140830.22737@burro.dasd.honeywell.com>
Source record: 36994

Recently my SupraDrive 30mB hard disk refused to boot, and I could not access it or reinstall it from the desktop. Initially I thought that the controller was fritzed, until I realized that the system clock's time was still being set from the Supra SCSI controller. So I opened the case again, and after a few power cycles I heard a familiar sound that I had been missing--the drive platter spinning up to speed!

Question: Is there any proactive work I can do to salvage this drive, to keep it from sticking? or should I consider this a warning sign of death and set about obtaining another drive mechanism to minimize (or elimanate) down time ???

Comments?? Related experiances?? Help??? Advice??

>Ok, if you want to talk cost, let's make something clear first - who is the
>targeted customer for this GEMulator product? Obviously, someone who has a lot
>of money already invested in ST software. Such a person is also likely to have
^^^ Likely,
but not necessarily, I have probably $1000 invested in music software, but
not very much in the hardware.

>a substantial amount of money already invested in ST hardware. Is it likely
>that this person is now going to shell out bucks to invest in a complete PC
>system, and then also purchase a GEMulator, just to be able to run a fraction
>of the ST software on it?

The GEMulator's targeted customer is not intended for those with a large
investment in the ST, I don't know anyone that would buy a PC just to emulate
the ATARI. I believe that it is mainly targeted at the many Atari enthusiasts
that have some investment in Atari software, but for one of a million different
reasons, also own a PC (perhaps they like support). If you already own a PC (as
in my case) the GEMulator is much cheaper than upgrading the hardware on my the
Atari, and despite your argument to the contrary, it IS cheaper to buy add-ons
for the PC than the ATARI (and you can probably find a local dealer to purchase from)

>For most ST users, the cost to be able to use GEMulator has a floor of $500 to
>$1000, to obtain a usable 386-based PC system. Who knows what kind of video
>and disk controller cards you'll get in such a machine, what kind of memory

Even a generic VGA video card (which can be bought for $25-30 still has
better resolutions than an ST

>size, etc... On the other hand, the raw components are the same, and cost the
^^^ Granted the RAW compnents cost the
same, but there is a big difference in the final costs, like where are you
going to put the drive. Chances are you will need an external case and an
extra power supply

>same. Why buy a PC with 8MB of RAM, when you could simply put 8MB into your ST?
^^^ Right! try it
on a 1040ST and tell me how cheaply (or easily) it is done. (And you'll still
probably be limited to 4MB)

>(In particular, why buy a PC with 8MB of RAM when most applications still only
>use 640K; the extended RAM can only be used as virtual disk, file cache, and
^^^ NOT true, in the past maybe, but today almost all major software
(ie software requiring more than 640k) uses either expanded, extended, or
DPMI memory

>swap, most of the time. Not that an 8 MB disk cache is bad, mind you, but it
>*is* a little silly when you really want to be using a large program on a
>large data set...) If you want a high density floppy drive, it costs the same

Hi-

I'm posting this for a friend... You can respond to him, to me (in which case I'll forward your response), or to both of us. Your choice. :-) His address is 'wrenn@chewy.larc.nasa.gov'.

He's got a TT at work, and has recently acquired MultiTOS. He's got Uniterm and Flash II (both), and neither seems to do what he wants under MultiTOS. Both programs lose characters when in terminal mode, and both hog the entire display in lieu of running in a window.

Does anybody know how one or both of these problems can be straightened out, for either or both of these packages? Is there a MultiTOS configuration program and/or accessory, that might allocate more priority to the serial port? Is there anything out there that'll force a program to run in a window?

Any help would be appreciated...

John

I need to find a compiled version of the GNU Objective C compiler. I do not have the resources to compile this compiler (not enough disk space). I would also like the libraries and such that go with it. If anyone can help, please E-Mail me. Even if its just the name of a file and an ftp site!

Also, the GNU compiler 2.4.2 hasn't been working well for me. It keeps giving an error 1. Is 2.4.4 fixed? Or do I need to go back to an older compiler?

Also, I have heard that Objective C was supposed to come with an Interpretter. Does the GNU version have an Interpretter? Is there ANY PD interpretter available?

I'd like to create an Objective C library for GEM, and use that for all my GEM work, maybe model some of the objects from GEMFAST calls and some from NeXT objects.

Festplatte (Megafile 30) zwar lesen kann , aber nicht beschreiben bzw.
formatieren , d.h. beim Schreiben werden die Daten der jeweiligen
Partition zerstoert und Formatieren tut er nicht .

Ich nehme an das dies mit dem DMA - Baustein oder einem
Interface - Treiberbaustein zu tun hat .

Hat da jemand schon mal aehnliche Probleme gehabt oder kann mir
irgendwie weiterhelfen ?

Fuer jeden Hinweis dankbar ...
ONRA

4352. 720k drive on 520ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-25 03:37:35 UTC
From: mheim@cogsci.uwo.ca
Message-ID: <1993Aug25.033735.4769@julian.uwo.ca>
Source record: 37000

I've got an old Atari 520STfm and a mono monitor. It's been upgraded to 1 Meg. It has one of the old single-sided 360k disk drives. The drive is the biggest thing holding me back from making any use of the system. I have ftp access on UNIX, and can write to 3.5in disks on IBM PC's, but can't write so that the Atari can read them. I'd like to get a new drive (720k), because I've heard that if the IBM formats a disk of this type, the ST will read it.

What should I look for in a drive that will work with the ST? Do people still sell 720k drives, and will they plug right into the ST? Can I make the new drive Drive A, and the old one Drive B? I remember reading how to do this in an old Atari mag, but have since lost it.

Any help would be appreciated.

4353. digital to analog hardware for the ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-25 06:03:49 UTC
From: jaszcz@donald.EEAP.CWRU.Edu
Message-ID: <25evc5$1rn@usenet.INS.CWRU.Edu>
Source record: 37002

hello,

does anyone know of any digital to analog hardware for the ST?
i'm interested in driving three mirrors that would reflect a laser
beam. so, the hardware would have to have three or four channels.
i have a 1040STf, which would probably mean using the cartridge port.
(i hope the cartridge port is writable--i remember reading something about
not being able to do it easily..)

any info would be appreciated...

Hi folks,

I'm currently using PageStream and a HP DeskJet Plus. I'm considering to switch to a laser printer, the new HP 4L. Since PageStream isn't supported anymore, I have this question: is the LaserJet printer driver capable of running the HP 4L?

Thanx
Mike

Try the demo version of OUTSIDE on ftp.uni-kl.de in pub/atari/other_demos.
You need at least MiNT 1.05 for virtual memory.

Message-ID: <tiemann.746312642@elektra>
Source record: 37010

Hello,

sorry, I don't want to waste bandwidth but I don't see the reason,
why gcc isn't running on my machine. I use BMGCC245 but the situation
was the same with GCC241.

When I try to compile anything the message "gcc-cpp: unknown option -lang-c"
appears.

What's the problem? Anything with gcc.ttp giving wrong options to the
preprocessor, but why?

Thanks for any help!

Bjoern

My understanding is that the HP 4L requires a new printer driver to get
at the higher resolutions. Using the standard HP drivers will result
in 300dpi output. No gain...

Can someone verify this?

That's ok, since the highest resolution the 4L can print at is 300 dpi
(with resolution enhancement). The Laserjet 4 (no L) is capable of
600 dpi. The problem with the 4L is that all the controls are handled
through software. There is only a reset button on the printer. There
isn't even a power switch. Of course, the printer only comes with
Windows and DOS control programs, so it's not possible to turn on the
economode, resolutionm enhancement, etc from an unsupported computer.
You might be able to find a control program in the public domain,
though. I've seen one for other unsupported computers (Amiga).

4364. ICD Link problems?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-26 06:39:50 UTC
From: chan_c@cs.uwa.oz.au
Message-ID: <chan_c.746347190@kultarr>
Source record: 37016

Hi everyone,
Just a little query that I would like to make.
I bought 'The Link' HD controller from ICD about 8 months ago
and I would like to know if it can daisy chain 2 hard disk
drives together. A few have told me that it would not be
possible due to some hardware problems on 'The Link'
but the understanding that I get from the manual is
that you can hook up as many SCSI devices to it.
Did I read the manual wrongly or is there a defect in it.

The reason I am asking is that I am thinking of getting
another hard drive and would like to chain it to the external
one that I have now.

On the topic of hard drives. Is there any difference
in the Quantam LP240 and LPS240? They are both 3.5" drives and
they look the same but is there any functionality difference
between them? I have the LP240 and was looking for another 240Mb
drive. The dealer has one in stock and it was a LPS240. Can I hook
that up together with my LP240?

By the way, I have a Mega 4 STE with 48Mb internal HD and
using a mono monitor. Oh I have just installed a 1.44Mb disk drive
and boy does it make a difference. My system came with the 720K
drive which was adequate but 1.44 is better. Had to fiddle with the
jumpers on the drive though. That was a real hassle.

I don't know about Flash II, but Uniterm only runs in ST mono or medium
resolution because it writes directly to screen memory. I would heartily
suggest switching to CoNnect, a multi-window communications program that
works wonderfully well with MultiTOS.

4366. Is my Falcon too slow?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-26 07:42:00 UTC
From: Stefan_Damerau@sl.maus.de
Message-ID: <A50091@SL.maus.de>
Source record: 37024

Hi!

Tuesday I purchased a Falcon 4/65 and the probs begin real soon, if they are
problems ...

I got GemBench 3.1 by Ofir Gal last night (ï¿½5 cash in a letter Ofir?)
and couldn't stop me testing my Falcon with it.
And that was it:
****
GEM Bench v3.10 ï¿½ Ofir Gal 5.8.93
==
Falcon 030 TOS 4.04, MiNT not present <--- TOS 4.04, take care!
Blitter Enabled, NVDI not present
Video Mode = 640 * 200 * 16 Colours
FPU not present
Run and Malloc from STRAM
Reference = F030
After Hard-Reset, no AUTOs no ACCs
==
GEM Dialog Box: 4.290 90%
VDI Text: 4.385 87%
VDI Text Effects: 7.820 106%
VDI Small Text: 4.810 88%
VDI Graphics: 7.695 120%
GEM Window: 1.745 87%
Integer Division: 1.545 100%
Float Math: 2.700 98%
RAM Access: 1.090 100%
ROM Access: 1.140 101%
Blitting: 1.400 82%
VDI Scroll: 3.980 71%
Justified Text: 4.310 84%
VDI Enquire: 1.710 100%
==
Average: 93%
Graphics: 91%
CPU: 99%
****
This seems quite strange to me.
Does the TOS-Version make a difference in Speed or why do i get sometimes
slower, sometimes faster results?

Help wanted ;-)

Bye
Stefan

Probably you forgot to upgrade the preprocessor too. Try running
gcc-cpp -version, the version number should be the same as that of
gcc-cc1 or gcc.

^^^^^^^^^^^^^^^^^^^^^^

This is why you didn't get 100% on all tests. GEMBench always uses 640*400
monochrome as a reference. 16 colours is bound to be a little slower.
The differences between versions of TOS 4.0x are marginal. Results should be
between 98% and 102% on a clean system. Let me know if you have anymore
problems. I am about to release v3.20 which includes Gemulator support.

Anyone-

This has got to be the dumbest problem in the world. Check this out.

I have the following set-up:

- ATARI 1040STf TOS 1.0 :-<
- 2 DS/DD Disk Drives

ok,

BOOT DISK:

- AUTO/ETERNAL2.PRG
- AUTO/RAMDISK.DAT w/ "D400"
- AUTO/((GEMENV.PRG - loads SOZOBON /BIN, /INCLUDE, /HOME, etc..)
ROOT.ENV contains:
LIB=A:\SOZOBON\LIB\
INCLUDE=A:\SOZOBON\LIB\
BIN=A:\SOZOBON\BIN\
etc............
- VI (loaded into Ramdisk)
- .c source files (loaded into Ramdisk)
- MUPFEL.PRG & MUPFEL.MUP (loaded into Ramdisk)
MUPFEL.MUP contains:
PATH=A:\SOZOBON\LIB\;D:\
CDPATH=D:\
LIB=A:\SOZOBON\LIB;
INCLUDE=A:\SOZOBON\INCLUDE\
HOME=D:\
etc..........

After the boot disk loads the gemvariables, creates a 400K ramdisk, and
copys all of the above programs to it, I replace it with a disk
containing:
```

SOZOBON\BIN\
SOZOBON\INCLUDE\
SOZOBON\LIB\

right! But wait.

when I am at the d:\ prompt, it WILL NOT RECOGNIZE ANY .TTP's THAT ARE
IN SOZOBON\BIN!!!

Total nonsense Howard. Give me some numbers. Real hard numbers. Yes you can
put 8 meg into an ST. FOR HOW MUCH? Yes you can upgrade the video to
Moniterm or ISAC or Crazy Dots. FOR HOW MUCH? Yes you can upgrade to TOS 2.06
or MultiTOS. FOR HOW MUCH? Yes you can upgrade to a high density floppy.
HOW MUCH? A larger hard disk (I fail to understand how people can talk about
direct to disk capabilities of the Falcon when the stupid thing comes with
way too little RAM and hard disk space to be useful. Again more cash for
a real Falcon). You can get a 16 Mhz or 20 Mhz upgrade for the ST. HOW MUCH?
You can get a 386 emulator. HOW MUCH?

HOW MUCH HOWARD??????? HOW MUCH MONEY DO ATARI USERS NEED TO KEEP THROWING
INTO A BOTTOMLESS PIT HOWARD?????????

The kind of people who buy Gemulator are both the type you describe (mondo
investement in Atari hardware) as well as the type who have a minimal
520ST or 1040ST system and just are not willing to shell out $1000+ to
get a new Mega STE or Falcon. They need a more powerful machine to run some
of the newer ST software. So what do they do?

A person has lots of options to get a more powerful piece of hardware to run
their ST software on. We're no talking about someone who specifically
wants to buy a Falcon because they want to tinker with the DSP or a developer
who buys a Falcon to test software compatibility on. We're talking about
your average Atari user who to date typically goes through great lengths to
get a decent system out of his ST - 16 Mhz upgrades, PC emulators, large
monitors, memory ugprades, etc. Here are 4 options:

1 - upgrade the existing ST. After butchering the ST to pieces (a nice
little side effect of a closed system like the ST) you're looking at
$1000+ for upgrading to the equivalent of a decent Mega STE or Falcon.

PC emulation extra. Good luck if anything ever breaks down.

2 - buy new Atari hardware, like a new Mega STE or Falcon. $1199 for a bare bones Falcon, + hundreds for a monitor, + hundreds of a decent RAM and hard disk upgrade. PC emulation extra. The "under $1000 68030 machine" Atari promised us years ago is now $2000+. Accoring to one magazine review out of Europe, the Falcon has a 40% compatibility rate with ST games and 70% with non-games. Put more money in the pockets of the Tramiels so they can use it for more stock flips and fund their future game machine projects (the "new" direction of the company? not that it's ever been anything otherwise!)

3 - buy a Mac. Hey, for what you pay for a 68030 based Atari running MultiTOS you can get a 68040 based Mac running System 7 with full color graphics and high density drives. Remember Dave Small's wonder emulator doesn't quite support any of that, so to run Mac software written since Ronald RayGun left office, you gotta but the real thing. Even I have a Mac at home. Major drawback: 0% Atari compatiblity.

4 - buy new PC hardware with Gemulator. $1500 to $2500 for a complete 486 system depending on what system you get and from which dealer. Full PC emulation is included <grin> and compatibility with non game and non MIDI software is almost 100%, better than the TT or Falcon. Some Atari dealers themselves sell 486/33 systems (complete with monitor and hard disk and Gemulator with TOS 2.06 ROMs) for about $1500. Add $500 to $1000 for a localbus 486/66 machine which will run as fast as a Falcon, and give you full support for DOS, Windows, OS/2, NT, UNIX, and whatever else comes along. I haven't seen IBM or Microsoft or Sun or Apple talking about porting their OSes to the ST, have you?

Sure, there's arguments for all 4 cases, with you obviously being a big supporter of #1. But your argument is only the lazy man's bandaid solution. A year or two when the ST market gets even deader, when more dealer shut down or covert to other platforms, when more ST magazines die, when more user groups break up, you'll be looking for a new computer anyway. So you'll end up going with #2, #3, or #4.

I welcome a discussion of pros and cons of all of the above methods. But please back it up with something solid like prices instead of just saying "well you can do this and you can do this and you can do this". You can grow watermelons in your car's trunk if I want to but you don't do it without a reason.

- Darek

ISAC's were being blown out for $299, if I remember correctly.
The more promising video upgrade I've seen are the Lexicor NOVA cards which
are essentially modified PC VGA and SVGA cards. These go for between $300 to
$1000.

I am not aware of an 8MB expansion for the ST series, but I would be interested
in one if it is cost-effective.

High-density floppy add-on... apparently some have do-it-yourself (< $80)
upgrades for it, as well as commercial (<$130) upgrades.

TOS 2.06 is $140 using the TEC board.

Add it all up and the typical ST user might scratch his or her head and
consider a $799 Falcon which (as you say) has too little RAM and HD space
for direct-to-disk recording. :)

>HOW MUCH HOWARD??????? HOW MUCH MONEY DO ATARI USERS NEED TO KEEP THROWING
>INTO A BOTTOMLESS PIT HOWARD?????????
>

Well it would cost less than to buy a 486SX/25 + GEMulator. :)

(However, the reality is, those who buy a GEMulator would have other uses
for the PC that would probably justify the system purchases other than to
emulate an Atari at 8mhz speed)

>The kind of people who buy Gemulator are both the type you describe (mondo

>

Well, Darek, if they can't afford $1000 for a system, then they can't afford
a 486/SX25 with a "good" VGA card in order to do decent ST emulation with the
GEMulator.

I think they can afford it.... I think they may not want to spend more than
$1000 on an Atari, but may go higher for a more permanent machine like a Mac
or PC clone.

Also, do you imply that GEMulator offers a more powerful platform than the
Falcon?

(I'm not sure you could adequately back that claim, even with a 486 66mhz box)

>A person has lots of options to get a more powerful piece of hardware to run

That's true. But the same can be said for almost any small company's hardware
support, especially for older machines. If someone has a 4 yr. old PC and
brings it in dead to a clone dealer, they will most likely "fix it" by doing
a motherboard swap.

>2 - buy new Atari hardware, like a new Mega STE or Falcon. $1199 for a

Ok, a correction.. the "bare bones" Falcon is "only" $799. But I think it
is quite unusable.

I think the "base system" is the 4/80 system selling for $1200.

For $1200, and I speak only for myself, I'm not playing games. I really would not care if Dungeon Master works on it. I'm also sure that GEMulator would not be able to run many of the ST games because they come on copy protected disks.

I think in a sense, your presentation of the first two options somehow implies GEMulator can do these things... which it cannot.

>3 - buy a Mac. Hey, for what you pay for a 68030 based Atari running

That's true. But then, if you're buying a new computer, and you still have an ST and enough desktop space, there is no reason not to buy a Mac. :)

Ok, here are some things I kind of take issue with in your presentation:

1) $1500 for a complete 486/DX33 system is about right. That includes (usually) a SVGA card (a good one, too), 200MB HD, mouse, and 4MB of RAM. Assuming GEMulator takes up no RAM, this would give the user emulation of (roughly) 16mhz 68000 with no sound support, no MIDI, no joystick, no ability to read/write protected floppies, and it might be a tight fit to try to run GEMulator along with something else.

If the user's goal is to buy a high-end ST, for $1500, they would do better to just buy a TT030. Or a Falcon. In fact, looking at your mailing information, it says a 50mhz 80486 emulates roughly a 16mhz 68000.

The issue then is simply whether or not it is worth it for the end user to switch. If all they want (or need) is a fast ST, I don't think GEMulator can deliver unless it is running on a Pentium. A 16mhz 68000 was nice a while ago (and I'm using one now, so I guess I'm qualified to comment on it) but I feel that a 16mhz '030 is probably the bare minimum for someone doing serious work. The Falcon should have had a 33mhz CPU, IMHO.

If on the other hand, the user wants to escape the downward spiral of Atari computers (whether real or percieved... I think it is real enough), then

they will go PC or Mac, and if they need GEMulator to make the transition smoother, that's where the product comes in. But I think it is a little presumptuous to put an emulator of a 16mhz 68000 up against a machine with a 16mhz '030 and a 33mhz 56001 DSP and other enhancements as the option for an *Atari* power user. A PC power user would indeed enjoy a 486/66 (I'm going to definitely enjoy mine when i get it :)).

2) I've also noticed you have made claims at various times that you've sold more GEMulators than Atari has sold Falcons. Judging from the response at local music stores... I'd hazard a guess you're probably wrong. :)

3) The people who upgrade to a Falcon can "take along" their ST monitor. They can also bring up their hard drives, modems, etc... albeit with different cables, and perhaps even support software. But it is not a completely new system purchase like a PC, where the SC1224 would be useless as a monitor, or a SCSI drive might require additional purchases because that $1500 system only includes IDE, not SCSI.

I think you've got a nice product and I think it is probably an excellent job of emulation. I do think it has some things missing I wish were in it (MIDI!), but overall, it is a killer product. I just think it isn't realistic to claim it is comparable to a high-end Atari (i.e., Falcon or TT) in overall features and performance because it lacks a lot of the features of those particular boxes, and as I've said, if the user wants a high powered ST, they are probably stuck with Atari products. Perhaps as GEMulator is upgraded and faster Intel CPUs become cheaper (a Pentium should be able to give TT performance) you could eliminate Atari's high end. :)

>But please back it up with something solid like prices instead of just
>saying "well you can do this and you can do this and you can do this".
>You can grow watermelons in your car's trunk if I want to but you don't
>do it without a reason.

Well, let me summarize it all.. into a neat paragraph or so.

GEMulator is great. I think it is perfect for someone using an 8mhz ST machine, or maybe even STe, who is sick of Atari's so-so performance in the comptuer industry and wants to jump to a more secure platform.

But if the user needs a more powerful ST, I don't think a 486/66 running like a 24mhz 68000 is going to be enough. I think in that case, they would do better to get a Falcon or TT.

Also, I'd love to see you add MIDI support. I know you've said no one has made a big deal of it, so let me be one of the first to whine about it. :)

4379. Right Mouse Button

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-28 07:22:36 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CCGKHp.BI6@sdf.lonestar.org>
Source record: 37033

Alright folks, who has code for waiting for either the left mouse button OR the right button? How should this be done. I'd like to keep the system responsive, yet I don't want to waste CPU time by calling 2 different functions a million times. I might be able to simply not wait for a left button event. However, it helps for window-dialogs.

My only idea is to only wait for a left button during a window dialog, but wait for a right one elsewhere. Basically, I'd like to use the right button to "drag" the interior of a window (like Gemview) along with some other uses.

Thanks.

I'm not sure exactly what the problem is with your setup but I've found that connecting things to the Falcon via a headphone jack is a very nice way to get sound into the microphone jack. What I'd suggest is getting a 1/4" stereo plug to 1/8" stereo mini jack adapter and then a 1/8" stereo extension cord (it has a 1/8" stereo plug on both ends), then you can plug your CD player (or pre-amp for that matter) right into the Falcon mic jack. I've found the volume needs to be at about 1/3 level or so, your mileage may vary. This doesn't require the attenuators at all since the impendances match up nicely running from a headphone out into the microphone input.

One note : If you are hooking up to your receiver or pre-amp (or really anything with a headphone out), be sure to turn off all bass-boosting type stuff, just get it down to the original signal, otherwise you get really crummy digitized sound that gets clipped very easily.

I've been programming the sound stuff on the Falcon now for a few weeks, after finally sussing out some of the commands, I thought everything was OK, I seemed to be able to send data from the disks through the DMA, DSP to the DAC.

However, now I'm experiencing an exasperating problem... I want the DSP to pick up, (say) every 16th frame and treat it differently to the rest of the data,

4382. System Audio Manager, how?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-28 12:05:52 UTC
From: skele08@atlantis.cs.umu.se
Message-ID: <CCGxLt.6vD@cs.umu.se>
Source record: 37034

Greetings,

I recently learned that SAM (System Audio Manager) allows program to install sounds into it, allowing users to change the sounds used in different programs. The way I understand it, SAM reads a file called *.SAA that contains the different events in a program that can trigger a sound. The user then assignes sounds to these events in the SAM config accessory. I then assume that the program signals SAM that an event previously installed is happening and SAM then plays the sound.

If this is correct, does anybody know the format of the SAA file and how do I tell SAM to play the sound?
If I'm wrong, how does it work? Does it work at all? :-)

I'd really enjoy having a cool Twin Peaks or StarTrek sample amuse me with something witty when my compiles fails or (more seldom) works.

Thankfull for any help...

/Olof Tjerngren,

Hello,

For now, to use both right and left buttons when I call
evnt_multi, I set an EVNT_TIMER, for a very short time.
Yes, no with MultiTos, such a busy wait is unacceptable.
So, I wonder if there was any patches to the system using
the same methods than Let'em fly use for example to change
the treatment of evnt_multi. Even if a rewrite of the function
is impossible because the lacks of documentation, it may be
possible to change the behaviour of it. Personnally I've never
used the possibility of expecting an event from the two buttons
together. Won't it be possible to change it to expect an event
from one or the other button ? I suppose it's quite a small
patch that we could do for our own application only. Is
someone documented enough to examinate such a solution ?

yeah while this is true and comes up over and over again, i
would suggest getting a hold of a copy of a virtual memory program
like OUTSIDE (lexicor is selling it in USA send mail to Yat Siu (hi Yat!)
[drnibble@wpi.wpi.edu]) and not worry about memory again (of course
for any of the virtual mem programs you need a 030 equipped atari).

KG> out & buy 2MB simms. If not, I guess I'll just have to buy the 4 4MB
KG> simm$...

I can assure you that an 8 megabyte configuration is not possible with the RAM Gizmo. 1 Meg (using 4 - 256K simms), 4 Meg (using 4 - 1meg simms), and 14 Meg (using 4 - 4meg simms) are the only options available. The RAM Gizmo will accept either 8 or 9 bit simms that are at least 80ns or faster. If you have any other questions about the RAM Gizmo or any of our other products please feel free to ask!

Since I designed the Ram Gizmo, I think I may be qualified to answer this
question for you. :-)

1) Toad does not sell the Ram Gizmo and doesn't know a damned thing about
it.

2) Toad DOES sell an import that they CLAIM will do 8meg with just 2
SIMMS. I have my doubts of this, since the info I have indicates
that the machine will only recognize 1, 4, or 14 meg of RAM,
ergo, an 8 meg configuration shouldn't be possible, but I won't say
it can't be done, by virtue of the fact that the RAM Gizmo shouldn't
be possible either :-). I just can't see how it would be possible at
this point in time. Additionally, the Falcon has a 32 bit
memory bus. It just won't run with 2 8-bit wide SIMMS. So either TOAD
is selling a memory board that uses 32-bit SIMMS, or they are
misinformed about the whole deal.

3) The RAM Gizmo REQUIRES ALL SIMMs to be installed, and they should all
be the same size unless you like major headaches. :-)

4) You need to try to stay away from Panasonic and Mitsubishi SIMMs if at
all possible. These seem to place a bit of an unusual busload on
the system in the current design. If you DO get Panasonic or
Mitsubishi SIMMs, don't panic. I do have a fix for the problem, and
you can send the thing back and have it modified for free. The next
run of boards that comes in (which is sceduled for the first of
October) will have the fix incorporated into the board.

If you have any other questions, don't hesitate to ask me here, or Jim Collins
on Delphi and Genie.

Sounds like CRAZYSOUNDS; with that you can also assign samples to all kinds
of system functions (and if you have a Falcon record own samples); costs
about $40-50. Works both on ST's as STE's. If you'd want a cheaper
solution, try to find BEFORE DAWN (DAWN122.*) and a demo of Crazysounds and
Paula/Petra (*.mod player). It's basically a screen saver into which you
can load & play various kinds of graphics and animations. As a matter of
fact you can have the Enterprise floating around on your screen and have
Paula playing the Enterprise theme at the same time. Or have a short
animation running while every thirty seconds a jive voice says:
'Hellloooooobaby!' It does take some CPU time and RAM, of course.

good luck,

Paul

4391. DIY memory expansion with C101601-38 MMU

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-29 14:38:11 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <110751@hydra.gatech.EDU>
Source record: 36892

Hello technically inclined Atarians!

I would like to do a memory expansion on my 1040ST. The problem is that I don't have the MMU described in the files on atari.archive. The part number of my MMU is:

C101601-38

It is an 80 pin, rectangular, surface mounted chip. I have been told that this MMU has the extra address line to address up to 4 megs of RAM. The person who told me this does RAM upgrades but he wasn't willing to share this information with me. He'd rather I pay him to install a commercial upgrade board. If anybody knows the pin outs of this chip, I'd appreciate the information so I can do a DIY upgrade. Thank you!

Hey all.. I haven't done much programming on the ST in C.. having mainly worked on Unix Boxes.. and have a few questions. How can I open various ports on the ST to read/write to them? (Modem, Printer, Midi..) Also, what would be a good place to look for doing graphics stuff on the ST? I'm used to X and GL myself, and don't know where to start for stuff on the St.. thanks!

>A year or two when the ST market gets even deader, when more dealer shut
>down or covert to other platforms, when more ST magazines die, when more
>user groups break up, you'll be looking for a new computer anyway. So
>you'll end up going with #2, #3, or #4.

Parts of those argument #3, #4 are for systems that don't run Atari software, or that later you won't want the Atari emulation. You specificlly mention not "wasting" money on Atari products. For the clone, you mention that you can run other OSes and programs.

Maybe I'm strange. I don't like option #1 at all. I will only spend small amounts of money to upgrade a machine, and most of that on peripherals (disk, monitor, memory) that can be easily resold, or moved to the new computer.

I'd rather save my money and just upgrade to a NEW computer. Now, if I go to a clone, I see the Gemulator board in the "upgrade" category. Why would I want to spend $300 on it...when i could buy native software instead? You harp that the Atari market is "dead-end", and seem to indicate that I'll have to move totally over to the x86 (or mac) sometime. Why shouldn't I do that NOW, using the $300 I'd waste if I bought a Gemulator--if the Atari community dies like you say it will--the Gemulator is REALLY a waste of money. Hey, I can keep my ST (for 100% compatibility BTW) when I upgrade. Why should I spend more on a dead market? Hey, I'm just applying YOUR argument to it's conclusion.

I'm not saying that no one would buy a Gemulator (obviously false) or that for some, they need to run the Atari version of some software as no alternative exists. But in general, if you are going to MOVE ON, I say, MOVE ON. I would buy a Gemulator *if* I had some extra money lying around, it'd be a nice toy to play with (of course, I'd have to get the 486 FIRST).

4394. dialogs and multitos

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-30 00:47:51 UTC
From: sme4v@kelvin.seas.Virginia.EDU
Message-ID: <CCJrJs.3wq@murdoch.acc.Virginia.EDU>
Source record: 36896

I am having a problem using dialogs in multitos. After a dialog is closed, GEM sends redraw messages to any windows behind it. If I open another dialog, the dialog is drawn, but then the background windows redraw themselves over it. This is also a problem with background apps which update their window's work areas continuously (i.e. lines.app) are behind a dialog. I have noticed however that this does not happen to the dialogs in Atari Works. Does anyone know how to stop this from happening? Thanks.

Source record: 36897
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

greetings:

i'm trying to write a few simple midi programs for my atari st
using lattice c 5.5 and i can't find any call in the libraries
that flushes the midi port (the reason i want to flush it is that
the midi port keeps incoming notes that weren't read -- even
across program exits so the first thing i hear when i start my
program is usually a few goddam notes that were kept in there
from the previous run and never read)

also i couldn't find a way to associate a file descriptor to the
midi port so that i can use fflush()

one thing i tried to do, based on information on abacus's "atari
st internals" -- the most useless book ever printed -- is to write
to the status byte of the acia controlling the midi port a byte
doing the reset (bit 0 and 1 set) but that hangs the st: i go into
supervisor mode, write the byte to acia status register and get back
to user mode. i can read that status register (in supervisor mode)
no problem though. (i _assume_ it's that register i'm reading -- i'm
using the address given in "atari st internals"...)

any idea?

please reply in email as i don't usually keep up with this group
thanks

jacob

4396. how do you set an alarm on atari st [?]

Source record: 36898
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

greetings:

i'm trying to write a few simple programs for my atari st using
lattice c 5.5 and have tried to locate alarm() or sleep() or an equivalent
routine but with no luck. the only routine that "waits a certain amount
of time" is some AES that seems to be specific to AES...

how do you time yourself on the st? for example how do you perform a task
that needs to be performed at fixed intervals? obviously you can't
intersperse your program with code checking the system clock to see if
"that time" has arrived yet. something equivalent to alarm() and SIGALARM
handlers must exit.

any help greatly appreciated...

please reply in email as i don't usually keep up with this group
thanks

jacob

If it happens in your programs simply don't call Form_dial(FMD_FINISH,...)
if in other programs, complain to the authors.

It seems that your problem is that you do not make a wind_dial(FMD_START, ...)
and wind_dial(FMD_FINISH, ...) call correctly. The first one tell the AES,
that a dialog is gonig to be placed on the screen. The second call is necessary
to tell the AES that the dialog is done now and has to be replaced by the
background and window contents. If you do it correctly then it should work,
at least I have never encountered any problems with that.

>would suggest getting a hold of a copy of a virtual memory program
>like OUTSIDE (lexicor is selling it in USA send mail to Yat Siu (hi Yat!)
>[drnibble@wpi.wpi.edu]) and not worry about memory again (of course
>for any of the virtual mem programs you need a 030 equipped atari).

But for us unfortunates, with a 68000, this is not a solution. What we need, is for someone to get started on implementing swapping in MiNT. This may become dead-slow, but it should work in many cases. At least for a 4M machine, it should stop GCC from running out of memory, not matter how many shells, makes, emacs', is running.

I got a couple of ideas, but I haven't the time right now to start looking into it.

Have people noticed that when this trick is used in MultiTOS making double
clicks becomes virtually impossible? Even single clicks must be made very
firmly. Or has this been fixed in more recent versions?

Hi!

I just upgraded from MiNT 0.95 (old, but reliable) to MiNT 1.08.
System: Atari 520 ST (with 4 MB RAM)
Compliler: gcc2.3.3 (once again, old but ... ;-)
Compiled with MiNTlibs (don't know what version, but not the newest
one, I think)

The only thing I had to do was hacking in the makefile to prevent him
from building asmtrans.ttp and to unset -DMULTITOS.
Then renaming mint.prg to mintnp.prg, and all stuff was up and
running.

Thanks to everybody who replied to my (incompletely posted :-) call for help about running MiNT 1.0x on a 68000 ST. Seems like I'm the only one for which it doesn't work.

To eliminate side effects from disk drivers, AUTO programs and accessories, I ran MiNT 1.08 from A:\AUTO, with nothing else on that floppy. GEM came up, but I still got crashes when trying to run programs. I then switched tracing on, redirected the output to the serial port and tried again. Here's the sad result:

Darek,

Your argument is fairly lucid, so I won't bother replying to most of it.

There are several problems with it, but now that I did an f instead of F in trn I don't remember what they are! Ahahahaha! :-). I just want to point out that a "bare bones" Falcon is $799, not $1199 as you said. The $1199 Falcon is a 4/80 config. If planning on upgrading the HD and Memory as you said, that would be the wrong choice. The $799 modem is a 1/0 config.

Of course, I gather from previous messages that Atari did not put SIM slots in the Falcon, and in facct I think you need an upgrade board of some type to put in 14 MB. This is almost criminal on Atari's side. With IDE/SCSI though, the HD would be easy to top. (Prob. best to gget an external SCSI, as the internal IDE has to be 2.5" which is not cheap).

Can anyone out there send me the real story about the problems with the
Falcon's ad/da chip?? What seems to be the problem with it?? Is it just the
ad/da chip or is it the whole chipset? If it is the ad/da chip, it should be
quite an easy problem to fix (ie. buy a new ad/da chip)...
I'd appreciate any help in finding out what exactly is wrong with this aspect
of the Falcon. This is quite important as I'm planning to do a lot of
hard drive recording...

Thanks in advance..

4410. RDE_Version 5 (Upgrade & bugfix) sent to a.a.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-30 20:22:06 UTC
From: wabe@ukc.ac.uk
Message-ID: <5682@eagle.ukc.ac.uk>
Source record: 36910
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some of you have reported that the contents of "nearly-full"
saved RDE files can get corrupted on loading.

This puzzled me quite a bit, but thanks to Wojciech Surowka who
not only detected this (rare) bug, but also diagnosed the cause and indeed
suggested the cure - which is now implemented in Version 5.

Some GUI Enhancements are also incorporated. I reproduce (below)
the "new" bit of the documentation - which explains what I've said in
more detail.

Cheers,
W. Alan B. Evans

********** Part of Documentation of RDE_V5 **********

RDE (Version_5) - Upgrade and BugFix on RDE_Version_4.
****
(Distribution to the Public Domain

by kind permission of

Mark Williams Company)

RDE Version 5 improves the GUI on previous RDE versions in that:

i/ whenever a filename is to be chosen, it now uses a fileselector
rather than the dialogue box. The advantages are obvious.

ii/ On creating a ramdisk, the _precise_ desired size in Kbytes can
now be typed in via a dialogue box. If 711 or 811 kbytes is
requested, then the ramdisk is configured as an exact image of
the 2 popular Floppy Formats (720kb and 820kb) - see RDE_V3
documentation below.

iii/ When removing a ramdisk in the GUI, you are no longer "forced" to
remove one of your installed disks (unless you hit the warmstart
button). Of course there should have been a last chance to cancel,
and now there is!

BUG FIX
~~~~~~~

There has always been an obscure bug in Mark Williams' original
RDY and in all subsequent RDE Versions. The symptoms are that if a
"nearly full" ramdisk is saved to file and then restored, then its
~~~~~~~

contents near the top end can get corrupted. Luckily this hardly ever happens in normal usage - as most people would leave empty work space in the saved ramdisk and make sure the files are contiguous (i.e. "reorganise" or "defragment") before saving. Those who have used RDE to create ramdisks that are nearly-full (usually with "read-only" utilities) might have noticed the last few files on the disk are sometimes corrupted after loading.

I am indebted to Wojciech Surowka for diagnosing the trouble and, indeed, for suggesting a cure which is now implemented. From my tests, it appears to have done the job.

Basically during loading, RDE/RDY copy the contents of the saved file to high memory below PHYSTOP where the screen is. Now if it so happens that screen interrupts (mouse movement, flashing cursor etc.) are made during the load just AFTER the last few kbytes of contents have overwritten the screen and BEFORE the ensuing warm reset, then it is clearly possible for these contents to get corrupted.

The cure is, of course, to set the system byte of the Status Register so that all interrupts are disabled during the load.

Ramdisks created with Version_5 retain full compatibility with all earlier RDE versions.

I am not aware of any remaining bug in RDE.

Documentation(s) that accompanied previous versions are appended at the end. Newcomers to RDE can find useful hints by studying them. Users are reminded that RDE only displays its full flexibility if invoked from a shell with command line arguments. RDSH (available from the archives) is a tiny, quick-loading, shell tailored for easy command line invocation of RDE.

The current executable is about 22 kbytes and is not "packed". If you desire to pack it to about 12 kbytes or so, I recommend either ICE (version 2.4) or PFXPAK, both of which produce MINT compatible executables.

It goes without saying that neither I nor Mark Williams Co. will assume any responsiblity for whatever (dire or otherwise) consequences that may arise through the use of this software.

Cheers,
W. Alan B. Evans. (August 27th 1993)

4411. problem sending to modem on a 1040stf

DF>megs of RAM. The person who told me this does RAM upgrades but

This MMU does have the same address and other DRAM interface lines as the
old MMU, but there are no 'additional' lines (which would enable you to
get *more than* 4 Megs). The MSTE circuit diagram shows a ~120-pin GSTMCU,
so this is no help. Maybe someone with a newer version of the 'Profibuch'
(or an 1040STE circuit diagram) could look up the pin numbers for MAD9,
/CAS0L, /CAS0H, /CAS1L, /CAS1H,/RAS0, /RAS1 and /WE (that's all you need,
the rest can be traced from the old RAM chips). When you have found the
signals you need, the upgrade is basically the same for all ST models.

There's nothng wrong with the ad/da. Early prototypes had some problems, but
none of the production ones I've seen. The only thing to note is that the
convertors are not up to pro-audio quality. If you require top studio qualiy
you would need to get a direct digital interface to the DSP.

4415. Tape problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-31 02:19:09 UTC
From: sourada@iastate.edu
Message-ID: <sourada.746763549@vincent1.iastate.edu>
Source record: 36913
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm new to the world of tape drives, so please help me out.

Here's my hardware:
1040 STe w/4MB RAM
ICD AdSCSI+ adaptor
Quantum LPS240S (SCSI 0, no parity, etc.)
Tandberg 3600 tape drive (SCSI 1, no parity)
ICD adaptor software
TapeBIOS tape drive

(There are no problems with the adapter or hard drive, that I know of)

The tape drive will do some stuff, like retension, rewind, make noise... But when I try to run tapetest from the TapeBIOS package, it gets to the write part, makes some noise, stops, and gives me some sense data. I decoded the sense data and it says "hardware error" (sense key #4). Sounds bad.

So am I doing something wrong, or is the drive messed up?

Thanks a lot,
Steven Ourada

>>... both right and left buttons ...

>The way to do this is:

>evnt_multi(...MU_BUTTON...,258,3,0,...)

>Strange, but it works.

The reason is that the "258" means "wait for 2 clicks, and by-the-way, negate the state requirement", the "3" means "watch both buttons", the "0" means "wait until both 0". The effect of the "negate the state requirement" then is to make this "watch both buttons, and wait until NOT both 0".

evnt_multi(...MU_BUTTON...,258,3,0,...)

and

evnt_multi(...MU_BUTTON...,257,3,0,...)

should be all you'll usually need.

Of course, if you use GEM++, this is all handled for you. :-)

4417. MiNT devices

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-31 03:06:26 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.eg.2EMQnAesh0E@semprini.tdkcs.waterloo.on.ca>
Source record: 36949

I've thought of something really simple and neat; a screen saver daemon
that starts whatever .ttp program you've specified (or one randomly,
thus allowing for "modules").

The screen saver "modules" would be complete tos/ttp programs that are
allowed to use the VDI over any area of the screen; since they're not
GEM programs, they wouldn't be allowed to make any AES calls.

When the screen saver goes off, it'd attempt to allocate a screen's
worth of RAM (a screen could be pre-allocated if an option is set).
Then the server would blit the real screen to the saver buffer, and
Setscreen to the saver buffer. It would then invoke a module, which
could write all over the screen with impunity.

Before I get down and dirty with the saver server and modules and their
protocol, I'd like to know if theres any easy way of getting useful
information from the devices in /dev... It'd be truly fantastic if
/dev/kbd or /dev/console had as its "last modified" time the time of the
last keystroke... This doesn't look to be the case; all of the times
seem to be the current time. It'd be just as great if the mouse device
had the same timestamp features. :-\

Is there any way to get useful information from using stat() or
something on the devices?

Nope; if I try to load 2 or more ACCs, GEM dies with an Address Error
and MiNT exits (with exit code 2816). :-(

Before Dawn also locks up as soon as it tries to save the screen if
there's a mouse accelarator loaded (!). This could just be my system,
but it happens with both maccel3 and SilkMouse (my favourite).

My system is pretty vanilla as far as OSs are concerned. TOS 1.04, 4M
of RAM, monochrome.

Ew, yuck. It'd be a rather hellish mess; after all, things that we take for granted (flat memory, being able to access > 640k, etc) are either difficult or really, really arcane under DOS. Segments (yah, I like looking at those 1M image arrays in 64k chunks...) and the famous 640k limit (actually a 1088k limit these days) are death.

Try OS/2 or linux; it'll make life much easier (well, Linux sure won't, unless you know much about unix systems administration... I sure don't).

MiNT and semaphores...

Does MiNT support semaphores, or is there a way I can send
another process to sleep (if I have its PID) and also wake it
up again later?

This is not enough. I have talked with Mike Fulton via E-Mail: You must
make an wind_update(BEG_UPDATE) before you using a dialog and closed it
with wind_update(END_UPDATE). This must be done not only in MultiTOS also
in all Version of (single user) TOS greater or equal 4.04 it is necessary.

4423. Help needed for HSC mintlibs pl34

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-31 10:01:21 UTC
From: wmtwen@rwa.urc.tue.nl
Message-ID: <wmtwen.746790690@rwa.urc.tue.nl>
Source record: 36921

I was optimistic about the upgrade to Mintlibs pl34 from the old Dlibs.
Before I get to my question, first some hints and tips for installing
the libs.
You will need both mnthlb34.lzh and mntinc34.lzh.
Copy your old gemfast.h to gemfast.old
Copy all include files in mntinc34 to your include dir.
Replace the new gemfast.h with your saved gemfast.old
Replace the osbind.h frmo mntinc34.lzh with the osbind.h from
mnthlb34.lzh.
Now copy the rest of the files from mnthlb34.lzh to your lib dir.
That is it. I think there should have been a readme file telling this,
but you can read it here now.
Then the problems began.
First I tried compiling with this setup and found that exists() does no
longer exist. Not a major problem since such a function is easy to
write using the mintlibs.
But the real problem was that I could not link.
The linker complained about bsome undefined symbols.
The symbols were ___funcs ___fonts and some third three underscore
thing. All in linea.o in dlibs.a (the name for the mintlibs when used
with HSC). What does linea.o do in the dlibs???? And I do not even use
linea in my programs. So why does the linker complain.
Anyway I though that it was a mistake to include linea.o in the
mintlibs so I tried removing them using ar.
2 bombs. Strange strange strange...
For some reason I could extract files from the lib using ar but ar
would not delete files from a lib.
Hmm I suddenly think of a solution, but I would rather see this fixed
some way or another.
(the solution would be extracting all files from the libs and then
building a new one using ar, but I do know nothing about ordering of
libs so hopefully this would work...)

Any help is appreciated.

Erlend.

|>

You may not be doing anything wrong. Get a copy of the ICD's program SCSI.PRG. It will allow you to manually send commands to your SCSI tape drive, use the source from tapeBIOS to figure out the format of the commands. If this works then there is most likely 1) a timing problem or 2) an incompatability between TapeBIOS and the ICD firmware.

If the problem is an incompatability then you will need to change TapeBIOS to use the ICD hardware driver instead of it's own. I can send you some files that may help. (If you have Turbo/Pure C and Assembler)

True, and if you want to stop mouse presses on TOUCHEXIT objects
"falling through" to underlying windows, you ought to have
wind_update(BEG_MCTRL) and wind_update(END_MCTRL) around your dialog code.

4428. Extended VDI (GDOS) calls

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-31 13:40:23 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <CCMLzC.BAq@cs.bham.ac.uk>
Source record: 36925

Does anybody know what these calls do?

```
void v_xopnwk(short *,short *,short *,int,int,void **);
void v_xupdwk(int,void **,int,short *);
void vq_xextnd(int,int,short *,int,int);
```

They are declared in the Lattice 5.5 vdi.h header, and are commented
as "GDOS extended version".

Thanks in advance!

4429. DC shift when sampling on the Falcon.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-31 14:18:24 UTC
From: mmartin@neumann.une.edu.au
Message-ID: <mmartin.746806704@neumann.une.edu.au>
Source record: 36929

I have noticed that there is a small positive DC shift during sampling on my Falcon. Even with nothing plugged into the mic input the effect is quite evident and the larger the input gain is set the higher the shift. This appears as a horizontal line directly above the '0-line' on the screen in my program. If I sample a signal with a consistently low and even amplitude (such as a test-tone) it is obviously centered above the 0-line.

In many applications this would not be apparent especially with larger amplitudes, but it causes big problems for me as I need correct a/d conversion of signals in order to do frequency analysis. I also use a Falcon at the University here for the same purpose and the shift also occurs on that machine. Has anybody else noticed this? Any help would be copiously appreciated.

Mark.

4430. MULTISYNC for ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-08-31 16:21:33 UTC
From: Jinlung Fung <jf4y+@andrew.cmu.edu>
Message-ID: <wgUreB200VAuM5BG4s@andrew.cmu.edu>
Source record: 36926

I recently acquired a Princeton Ultra 14 multisync monitor and have been trying to make cables for it. I had little problem with the color modes but I am having some trouble with the monochrome mode.

According to ST Internals, the MONO DETECT line when toggled low will indicate to the ST to switch to the monochrome resolution. However, I have tried connecting that pin (I think it is pin 4) to ground (pin 13) but it does not seem to work. I have also tried connection it to pin 8 (+12V) just for curiosity but that did not change a thing either. Anyone knows how to get round this problem?

Another thing is that I noticed that there was quite a lot of flickering even in low-res mode. When the monitor runs on the IBM (my fren's machine so don't hammer me, hammer him), there is hardly any flicker. Why is this so? Any "cure" for it?

as spake by wmtwen@rwa.urc.tue.nl (Erlend Nagel) :
>I was optimistic about the upgrade to Mintlibs pl34 from the old Dlibs.

Uh-oh, I'm already worried... :-}

>You will need both mnthlb34.lzh and mntinc34.lzh.

(coff) Those are .zoo files.

[installation advice elided]
>That is it. I think there should have been a readme file telling this,
>but you can read it here now.

There is a readme file. I just checked. And it mentions everything
you describe. This combined with the filenames you mention lead me to
wonder if you might have gotten a repackaged archive. Where did you
get your copy?

[BTW: I've just noticed, to my mild chagrin, that the readme file is a
bit out of date, in that it mentions files like dlibs_8.a which are
1.40-compatible. Disregard that. There is only one set of files in
the pl34 release, and they are all compatible with v1.40. When (if?)
v2.0 is released, I'll release appropriate versions of the library.]

>First I tried compiling with this setup and found that exists() does no
>longer exist.

Right, that's a dLibs-specific extension.

>The linker complained about bsome undefined symbols.
>The symbols were ___funcs ___fonts and some third three underscore
>thing.

That would be ___aline. Hmm. This may have to do with a bug in the
1.40 linker; these variables are actually defined (in alglobal.o), but
if they're defined in the "wrong" way, the linker won't pull them out
of the library to resolve the reference. That bug is fixed in the 2.0
linker, so it's entirely possible that this might have slipped by me.
I'll check on it tonight.

> What does linea.o do in the dlibs????

It contains definitions for the Line-A routines.

> And I do not even use
>linea in my programs. So why does the linker complain.

Library drag. read() calls ioctl(), which for reasons of its own calls linea0(); so if your program does any file I/O, linea.o will be pulled in.

>Anyway I though that it was a mistake to include linea.o in the
>mintlibs so I tried removing them using ar.

And you'll get even more undefined symbol errors. They're there for a reason. Trust me on this.

>2 bombs. Strange strange strange...
>For some reason I could extract files from the lib using ar but ar
>would not delete files from a lib.

If memory serves (somebody check me on this), the `ar' in the 1.40 distribution was a bit flakey.

> (the solution would be extracting all files from the libs and then
>building a new one using ar, but I do know nothing about ordering of
>libs so hopefully this would work...)

Ordering doesn't matter (except for compile speed); the linker will repeatedly rescan the library until it no longer finds anything it can use. The modules in the MiNTlibs are in pretty much alphabetical order anyway.

>Any help is appreciated.

If the problem is what I think it is, I can have a fixed version ready by tomorrow.

Yes they're the extended open/update/inquire calls which have something of
a hokey-cokey existence in GDOS (in in 1.1, out in FSM, back in in Speedo -
I believe; feel free to shake it all about at this point :-)

They let you set things like page size & rasterizing buffer. It is my
intention (assuming I don't forget) to document them in the next manual
release.

4434. PC Ditto/Hard Disk

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-01 02:19:00 UTC
From: ak354@cleveland.Freenet.Edu
Message-ID: <2610qk$b3s@usenet.INS.CWRU.Edu>
Source record: 36930

PC Ditto Hard Disk Access

I'm running PC Ditto 3.01 on a 4 Meg Atari 1040 STe with TOS 2.06 and monochrome monitor. I am using version 6.0.7 of the ICD booter with an AdSCSI+ host adapter and a Quantum 240LPS drive. The drive is SCSI ID 0, LUN 0. Both read and write caching are disabled.

I have not been able to access the hard disk partitions from the PC Ditto emulator. I have the hard disk option selected in the PC Ditto menu. When I request a directory of the C: drive, I get a list of numbers with dates which look like file names, but aren't. The drive free space appears to be approximately correct. The C: partition is about 5 Meg.

I get similar results using the PC_DHD.SYS drive and trying to access the other partitions. Except for C: they are 32 Meg GEM partitions.

I'd appreciate any advice on where to look to resolve this problem.

4435. Microsoft RTF file format

Message-ID: <261l2c$dll@cismsun.univ-lyon1.fr>
Source record: 36932
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all.
I got a problem with Pure C:
I set the env variable SHELL=c:\bin\sh.ttp at bootup with GEMENV.
When I run Pure C, asking from menu "TOS shell" it tries to load
something but returns immediately to Pure C.
If I call Pure C from sh, it works.
My shell is Okami (latest version).

Another problem : I got a clipboard folder C:\CLIPBRD
that all my programs use correctly... BUT everest !
When I activate the GEM clipboard (GEM-Klemmbrett an) and I try to use it,
Everest tells me that there is no clipboard path.
In the env var I tries to put CLIPBRD=C:\CLIPBRD
and CLIPDIR=C:\CLIPBRD
but no avail !\

Has anyone a text or anything that explains the principal ENV-VARS to know ?

And what their value should be (path/prefix, etc...)

Thanx A lot !

Patrice

>
>Well, I got Motorola MV68020 (running at 15 MHz.)
>As far as I know that is pin-compatible to original 68000.

No, it is CODE 68000 compatible. It is not 68000 PIN-compatible at least for
one simple reason: 32bit data bus/32 bit address bus !
Even if you use only 16/24 bit buses, there is another problem:
68000 uses UDS/LDS (Upper data Strobe/Lower Data Strobe) to deal with 16/8 bit
memory read/write (the problem of BUS error on odd addresses with 16bit
transfers comes from this).
68020 and above get rid of this problem by using SIZ0/SIZ1 lines instead, and
DACK0/DACK1 (not sure about the latter) in reply from memory.
It IS possible to put a 68020 in place for a 68000, but you NEED some stuff
for converting these signals.
And when you're at it, you put a faster clock and a cache... But that's already
an accelerator board ! :-)

>Is there any idea to change to 020 and is there any pros and cons ?
>

In fact if you only convert these signals JUST to make it work like a 68000 at
the same speed (if you don't put a cache, you're almost obliged to) you won't
get much enhancement. The internal pipeline is improved, but since without
caching it will enter in wait states to wait for video and DMA access from
other chips, you won't gain anything significant...

>you would need to get a direct digital interface to the DSP.

Ahhh....therein lieth the problem!! Y'see, I'm really NOT doing sampling for
"home" use.... I am more likely to be using the Falcon for doing professional
type things.... (YOU try living with an audiophile!!!). In this case, I DO
need highish quality (studio-like). Hokay, so the big question is...
where can I get this direct digital interface and how much? Or with what
software?? (Cubase Audio, maybe???) A price quote would be appreciated. :)
Alternatively, would changing the ad/da chips do any good (I would think they
would, but you never know...)??

Thanks for the replies.

You miss the whole point Ted. My list of options below is for people who need a more powerful machine. i.e. you buy Calamus SL and find out your 1040ST doesn't quite have the requirements to run it. So you need a more powerful maching capable of running ST software. For as long as there is Atari software around (regardless of whether Atari is still around or not) there will be a demand for computers capable of running that software.

Yes, the Atari line is a dead end. I've been telling people that for years!!!! Buying any Atari hardware is a waste of money period. I don't deny that that's been my opinion of Atari for most of the last 5 years. So you haven't made any amazing discovery by realizing that yourself. But that's not what the point of the discussion below is about. Gemulator is NOT about getting PC users to suddendly start using Atari software. It's about offering an alternative to Atari hardware that still allows you to run your Atari software and not have to purchase a dead end computer. I don't know about you, but over the 6 years I've owned an ST I've built up a software library of several dozen programs, worth costing well over $2000. I'm sure the same is true of most Atari users, especially ones who use it to run applications. Unless you're a pirate, $200 is a small price to pay to maintain compatibility with hundreds or thousands of dollars worth of software.

Also, Gemulator is a $229 product, complete with ROMs. That's the list price. Street price at most dealers who carry it is $199. Perhaps you need to brush up on your math (you are probably American born and educated, which would explain a lot) because $229 DOES NOT round up to $300.

Now if you want to purchase a 486 and sell off all your ST hardware and software, that's entirely your choice. It's something I've advocated for years. But like you said, if you had the money. Do you have the money to replace that Atari software with equivalent PC software and do it for under $200? I doubt it. That's why Gemulator is a nice $200 solution to that problem. Buy the PC and Gemulator. Then over time buy more and more PC software. Since there are a lot of Atari users in this predicament (i.e. they don't all have thousands of dollars lying around to buy tons of PC software), a market for Gemulator exists. People will buy it unless everyone suddenly wins the lottery. <grin>

O.K., so we all get the drift. Enough of this guys. The Gemulator is a nice gadget. So is a Spectre GCR. I personally will buy a Falcon, not for anything else except the one main reason - my personal preference. The only thing I have against emulators is that they can never be 100% compatible, but then again, what ever is?

No, this is not a flame.
Just stop the bickering.

4444. Mint Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-02 05:08:50 UTC
From: Bryan.Hall@p0.f2703.n206.z1.FIDONET.ORG
Message-ID: <2548.2C88F0E4@mechanic.fidonet.org>
Source record: 36978

Just a quick question...

Is it possible to somehow pass a working file handle (actually a pipe in this instance) between processes? Normally I use a comm routine that just forks that allows two process's to write into a pipe (created with pipe). Under mint, Pfork runs the child process until it finishes, which doesn't allow the parent to contribute to the pipe. While I can easily create a named pipe and share data between a parent and child process, I can't figure out a way without fork to have two children writting into t
he pipe at the same time.

Thanks...

If you've just bought SL, SELL it (or return it) and buy a native app for
your new PC. I think you'll even SAVE money. This only works if you don't
NEED SL anymore...which you won't if you've JUST bought it. I think
someone would be really silly to buy SL for an 1040ST, but there are some
who'd try it.

Does ALL of that software need emulated? How well does UIS III intergrate
with Windows? Is Stalker that much better than Procomm for Windows (which
I can get FREE)? Games don't count either. Hmmm....I could run EdHak!
I don't know if you did this (factor in utility programs that won't be
needed if you go cold turkey).

Part of the argument is, I can always keep my old ST and run the programs
on IT. The program that I need to have more speed, I can replace with a
native version. Is Calumus SL really so good that a native Quark/Ventura/
Pagemaker aren't any better? And if you REALLY use SL, you can afford
either to move to a native version OR risk the paltry sum of a TT. Besides,
does it really run faster than a TT? Even SL won't be much of a case for
longer....aren't they porting it to NT?

Of course the problem with this is you have TWO machines....
it takes up lots of space (my room relfects this).

Unfortunatly, Gemulator doesn't seem to fit in my cube properly so I'm stuck. <g>

Any chance Gemulator will work under NeXTSTEP for Intel? Running Soft PC? Does it work under OS/2? NT? Alpha NT? MIPS NT? I know the market is small...but I'm just curious as IF I make the jump, I'll probably NOT be running Windows/DOS. Of course...that Power PC is looking nice..... (I'm starting saving now for the computer that I'll buy next year sometime.)

>Also, Gemulator is a $229 product, complete with ROMs. That's the list price.
>Street price at most dealers who carry it is $199. Perhaps you need to
>brush up on your math (you are probably American born and educated, which
>would explain a lot) because $229 DOES NOT round up to $300.

Sorry, I hadn't noticed the price drop, and I quoted from memory. Gemulator was originally $299 wasn't it? Of course, the price probably dropped a looong time ago. Sorry, my trivia engine just conked out and I got the number wrong. (Now ask me "What is Boskonia"? and I might fare better!)

There's nothing wrong with my math:
2+2 = 5 (for sufficiently large values of two, and small values of 5)
6*9 = 42
Besides, I'm a CIS major. O(300) = O(200).
See? What's so great about the Canadian educational system anyway?

Like I said...even at $200, that's $200 of native software I can buy to replace my OLD ST software (that I can either SELL to get money to replace the software, or run on my old ST). $200 can buy me Excel and Word with some nice change left over (of course I DO get the nice edu price...but I think that even buys the street price of the combo deal as well). Of course I could buy REAL software instead, from a REAL software company. <g>

>Now if you want to purchase a 486 and sell off all your ST hardware and
>software, that's entirely your choice. It's something I've advocated for

>suddenly wins the lottery. <grin>

Actually, I'm a bad judge for software. I use Stalker mostly....easy to replace. I don't buy much software...I've bought more Mac software, and I don't OWN a mac. Still, I made no beef with my opinion...If you are going to move, MOVE. For some, I do see Gemulator as a necessary step, and for others I see it as an attempt to keep that ol' Atari feeling around...mostly for nostalgia. I don't like colorized movies, so I do understand the nostalgia. Obviously I don't speak for everyone...or you wouldn't sell any product.

Rest assured Derek, if I win the lottery, I'll become a customer shortly thereafter. I really would like to play around with Gemulator. It'd be

worth it in amusemenet value alone (not to mention I might acutally put it to some real use). Heck I'll even buy it a FULL RETAIL if I win the lottery. Will you sign it for me? (I've asked God to let me win the lottery just so I can buy a PC and Gemulator. I expect to already have won...)

Otherwise, I factor in software prices as part of the upgrade. I won't buy a new computer without anything to run on it. I'd rather stiff it out for a few more months to add more money to the pot and then make the leap. Hey, it's worked for me in the past....The great thing about the ST is that they are so damned cheap it ain't worth sellin' (unless you just DON'T have the room). Who needs furniture anyway? Ahhhh! It's attack of the cable snakes!!!!

>Alternatively, would changing the ad/da chips do any good (I would think they
>would, but you never know...)??

The principal problem with the on-board ADC/DAC system is that it is in the
same box as half-a-ton of high-speed digital electronics. Shoe-horning a
better converter system into the same physical location (such a device is,
incidentally, unlikely to be pin-compatible with the existing device) will
not give any appreciable improvement, since performance is limited by the
electrical environment in which the converters are operating.

To do the best possible job requires a top-notch ADC/DAC mounted in a
separate (metal) box with its own power supplies (one for the analogue
side, one for the digital). The serial digital audio stream can then
be taken to/from the DSP port; this, and all the other control/data lines
should be optically isolated, such that the converter box is *completely*
electrically isolated from the computer. It would also be a wise precaution
to re-clock the data in the converter box with a PLL, in order to provide
the converters with a low-jitter clock.

With this approach, using an off-the-shelf chipset, it should be quite
possible to get around 16.5 to 17 bits of accuracy on the ADC, and 17 to
18 bits on the DAC, and it could be made to sound good enough for *most*
pro-audio users.

>Thanks for the replies.

You're welcome...

Hi folks,

I just heard a rumor that problems may arise when using a Syquest
removable hard disk as SCSI devices with odd addresses. It was
said the device may not be recognized, and in worst case, data
may be lost or corrupted. Is this true? Do I have to worry about
my Atari Megafile 44, which currently is ACSI device #1?

Source record: 36946

I bought a used copy of Timeworks Publisher ST a few weeks back.

I tried to create my first document with it the other night and had a problem. The headline at the *top* of the page was cut off (only the bottom 1/3 of it printed) as if it were off the page, but it was visible on the screen and according to the rulers was within the page dimensions. Some stuff located at the *bottom* edge of the page printed fine. I didn't see anything in the manual about staying away from the edges.

I was using landscape mode and a Panasonic 1123 printer. Any ideas what went wrong?

E-mail preferred as I don't check in here very often.

>Maybe obvious problems will come when filling the partition.

As I already said, I used HDX 5.04 for formatting and partitioning, and AHDI
6.06 for booting and use.

Problems would occur instantly, since the only question is, "Can GEMDOS handle
this huge cluster size?". Clusters per partition still is less than 32K, note
that HDX (an Atari tool) created the partition table...

Don't we all hate slow modem connections that irregularly swallow
the typework you send, and after you angrily smash a bunch of keys
at random burp it all out in one go to make you sheepishly look
at the illiterate result?

Well, today it amused my old '87 1040ST to teasingly do the very same
OFF-LINE, when I was using 1stWordPlus, only 5 minutes after a
perfectly normal cold floppy-boot.
It literally echoed my typework within a delay, varying from 1 to 4
seconds. SCARY!

I immediately knocked him powerless, and after letting him repent his sins
for 10 sec's I started him up the same way. No more trickery came up.

QUESTIONS: * What the ??? happened ? Sleepy keyboard processor ??
* Does the fact that my soundchip is slightly damaged
(printerport lowest bit is always 1 - bye bye ASCII)
for already a few years come in somewhere ?

The floppy is VIRUS-free,
and I've started up with it as is for years by now.

A bit worried,
Thanks in advance,
Rowdy Blokland,
The Netherlands.

>out there could confirm this for me BEFORE i run out & buy 2MB simms.

Bet you won't find 2 MB SIMMs. SIMM modules use DRAM chips, and these grow by factor 4, since adding one adress line to a DRAM chip doubles the number of lines AND columns of bits in the DRAM chip...

So we had 1, 4, 16, 64, 256, 1024 and 4096 KBit DRAMs and will soon have 16384 KBit thingies, but NO 2048 KBit chips and thus no 2048 KByte SIMMs.

>a million times. I might be able to simply not wait for a left button
>event.
>However, it helps for window-dialogs.

Well, Atari recently documented an "unknown" feature of evnt_multi() and
evnt_button: Adding 256 to the value in b_mclicks NOTs the meaning of b_mstate
and b_mmask, so that you can do a wait for

"NOT (both mouse buttons released)", which is "either button pressed"

with double click detection by an expression like

event=evnt_multi(MU_BUTTON, 258, 3, 0, ...)

This works with ANY version of AES, including TOS 1.00 and PC-GEM, and has been
documented to do so in one of the recent MultiTOS releases.

That's not true at all, at least not in my case. I am using a Syquest 44Mb drive and I have it configured as ID 1 and I have tried ID 3 and 4 as well and all of them work fine. It is quite a hardy drive and I have no problems with data corruption so far.

The "left channel missing in action" problem of some few F030s is a Sound DMA problem. Your Falcon dealer can easily fix it for you (for free!).

This depends on whether you need to support < 386 machines or not. If
you don't have to, get DJGPP (the DOS version of the GNU C/C++
compiler) and use it. It creates protected mode executables, which
means that all of the above is irrelevant and you get a nice flat
memory model with no brain-damaged limits, just like you're used to.
It evens gives you virtual memory. Porting Unix stuff is often trivial
with DJGPP.

>Try OS/2 or linux; it'll make life much easier (well, Linux sure won't,
>unless you know much about unix systems administration... I sure don't).

This will work too.

You could try a 1.44Meg drive instead. I was told that on an ST a 1.44M drive can be cheaper than
a replacement 720k drive.
This of course depends on your floppy controler. I was told that the WD1772 should be ok and you only need to connect the drive. (Correct me if this is wrong)
On an STe, however, you seem to need a new controler to use all 1.44Megs.

It might be worth to check what is required on your ST to connect a 1.44M drive and for how much.
When my drive quits (which seems to be the near future, given the very frequent stuff-ups) I'll
definitely will check it out.

Good luck

Michael

That's not necessaryially true. Not every OS will let DOS access any ol'
card. I think that both NT and NeXTSTEP might not like DOS accessing
hardware directly. I think that OS/2 is pretty laisez faire about it,
so it should work.

Anyway, I'd perfer to let Darek answer it. He's in the position to have
at least attempted it, and he should know lots more about it than I.

>>Like I said...even at $200, that's $200 of native software I can buy to

>Are you sure about those prices, $200 for both Excel and Word?

Yes, but I guess I was wrong about the normal retail price. From our
campus price list (WINDOWS):

X4567 VALUE PACK WORD & EXCEL WINDOWS SOFTWARE 3.5 166.25

I could buy it and have some change left over. This doesn't go for
every one though. When I bought the mac package, it was only $130! Then
I upgraded to Word 5.1 for $15! (To bad it's so damn slow!)

Source record: 36975

Hi,

does anybody still maintain the Gulam shell ? If not, are the sources
available somewhere ?

What is the latest version ? I've got 1.03.04.05 G of 121887 running here,
with the (G) patches for german keyboards.

I've used this shell since 1987, and still find it amazing how compact
(including many commands and an editor) and compatible it is.

All it would need to be well suited for the future would be fixing of the
"mem" command (which hangs under Mint) and the addition of job control.

4466. floppy died

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-03 12:58:19 UTC
From: greg@walrus.encore.com
Message-ID: <greg.747061099@walrus>
Source record: 36961

My floppy disk made an loud buzzing noise last night while I was running Minix (it had been showing some errors, but continued to run, so I just assumed it was bit-rot on the disk). Now it no longer reads anything from the disk when I boot. If I try to format a new diskette, it runs till the end, then makes the same long, loud buzzing noise. (was the drive about to fail anyway, or did minix do something the drive didn't like? Dunno)

Any suggestions? Is it completely broken, or does it just need recalibration somehow. Where should I look for a used-drive, assuming that one can be had for less than it would cost to fix this one.

Thanks,
-greg

Your're right, they do return the current time, so I don't think stat() will offer you anything. But I've been hacking on the biosfs part of mint for some time and have added ownership and so to the /dev/* entries and made them report the booting time, so I doubt it will be difficult to persuade them to report the last-key-pressed time. I think I'll have a look at this, only point is that you can't absolutely do this without doing something in the kernel code. I was just thinking about mailing ERS my ideas, perhaps I should wait to include this one also. Eric, are you listening? What about this? Does anybody perhaps think this would slow down the devices too much?

Well, it's not a question of which GDOS you use, only the type of the installed
printer drives matters (all Atari drivers for raster devices should have
them).

>This will work too.

Having just ported a Atari GEM program to MS-Windows, I can speak from
experience.

It can be done, even without these tools, but it isn't much fun. The
segments do indead pervade (pervert) everything, and you must surely
watch your step.

I must add, though, that programming for MS-Windows is much easier than
for GEM: it is much more modern, and given its history even surprisingly
consistent. Yeah, yeah, I know, it does have its problems, but compared
to GEM...

One thing that surprised me was the sorry state of C compilers.
Turbo C and Borland C, supposedly the points of origin of Pure C, are
certainly *inferior* to Pure C. Yes, they have C++, but the shell is less
easy to use, and what realy surprised me was that Borland C is easily a
factor two *slower* than Pure C, even on my 486SX at 33Mhz.

Finally, if you plan porting a GEM program to MS-Windows, forget about
trying it with judicious use of #ifdef or something like that. GEM
and MS-Windows are too different for that.

4472. jgraph port to ST ?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-03 23:12:37 UTC
From: whitbeck@equinox.unr.edu
Message-ID: <1993Sep3.231237.19262@unlv.edu>
Source record: 36973

Has jgraph (postscript graphing program) been ported to the ST?

I tried to do so using MWC. There are some long file names and long variable names to fix but that was not the problem.

A list of pointers is made and the address of the list gets corrupted on return from a subroutine call. I suspected a stack overflow problem (overfull?) and bumped _stlsize up to a big number (20000L...eventually 80000L) but to no avail.

If anyone could point me to a jgraph.ttp or could compile it using gcc (my ST is only 1M) I'd appreciate it.

BTW, If you have a postscript printer (or use gs or ...) this is a great little graphing program. I use it with TeX quite a bit on the Sun at work.

Jgraph is available via anonymous ftp to princeton.edu, in the file pub/jgraph.Z. This file is a compressed shell bundle file.

Jgraph is also available from netlib, a mail archive server. To acquire jgraph from netlib, send a mail message to netlib@ornl.gov with nothing but the text:

send jgraph.shar from jgraph

Thanks,

Mike W

The noise, I believe and have experienced, comes from the disk head trying to seek past track 80 or track 82, depending on your disk drive.

The causes in my case have been a bad Fat entry pointing to a sector past track 80. In Minix, possibly the same thing is happening, a pointer somewhere to a track greater than 80.

By the way, I have observed that the louder the sound, the farther the head is trying to move when it hits the end.

Good Luck!

==========

This is a common bug in the computer. I get it pretty often. Usually, the delay isn't timer based but your keyboard will lag behind by a few characters or you could move the mouse to make the rest of the characters appear. Mouse clicks are delayed in a similar manner.

A related bug is "phantom typist" in which instead of lagging behind it does the opposite and "lags ahead". It literally takes the last few characters or words that you typed and repeats them infinitely until you reboot. Don't type too fast and don't move the mouse whiel typing 1000 words per minnute or anything. It seems the problem is in the microcode for the keyboard processor or something. JUst try your best to save what you were doing (if possible) and reboot (warm reboot will do it).

> Can anyone tell me how this is done?

Try the sprintf()-function.

```
...
int err=35;
char message[256];
sprintf(message,"[1][Error %d][ %s | %s ]",err,"Ok","Cancel");
form_alert(1,message);
...
err=34;
sprintf(message,"[1][Error %d][ %s | %s ]",err,"ok","cancel");
form_alert(1,message);
...
```

And actually, it's not even really code compatible (the user-mode differences are pretty limited (mainly "move SR/CCR, <reg>"), but non-negligeable in supervisor mode)

4482. Register usage in gcc--which are fixed?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-05 02:39:59 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <26bjhv$hr@geraldo.cc.utexas.edu>
Source record: 36965

Hi,

I am trying to program some inline assembler in a C routine with gcc, and I seem to be fighting with the compiler for use of the registers. The assembler code uses all of the data registers and a0-a5. If I test the assembly code by including it in a "main" C routine, it compiles and works fine. But when I put it in my real C SUBroutine, I get a compilation error telling me that the contents of a fixed or reserved register have been "spilled". I know that gcc uses a6 for the stack frame, but what is a5 used for? Is there some way to steal this register back from the compiler, or do I need to rewrite my code? Does this have anything to do with the fact that the code is now in a subroutine, or that there are many other routines in the same C source file?

Thanks for any help.

St> Yes, there is 2MB SIMMs. Just ask Mac mail order place. However,
St> whethere the
St> RAM Gizmo knows how to handle it is uncertain. (Even in the case of
St> Mac, not
St> every Mac can handle those 2MB SIMMs.)

The RAM Gizmo will not handle 2MB SIMMs. The reason is quite simple. The only 2MB SIMMs in existence that I am aware of are all 32, 36, or 40 bit wide 72 pin SIMMs, and about the only thing at this point that uses them is the MAC and some workstations. The RAM Gizmo is designed to use industry standard, buy-em-anywhere, 8 or 9 bit wide 30 pin SIMMs, which are widely used in IBM PC compatible machines, and also the Atari STe machines.

Later,
Gizmo

No, you're right. Sorry for my late reply btw; your mail got routed through
to my 'other' host, whose system died five minutes after he left for a
holiday.

All GFA BASIC UUCICOs (supplied with Hermes and Mercury) can't handle a
flexible chatscript; the former UUCICO maintainer confirmed this. A
temporary solution woul be to change UUCICO so that it would ALWAYS needs
five statements in a chat file instead of three, but I didn't come across
any recent listings yet.

> systems file like this (adapt it to what form of configfiles hermes

4485. hard drive, monitor, mouse problem!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-06 02:51:01 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1993Sep5.225101.1@sscl.uwo.ca>
Source record: 36981

I seem to be having a weird problem with my hard drive, monitors, and mouse! The mouse (a replacement -- 'beetle mouse') works fine on OTHER computers; the computer itself works with other mice (like the old clunky Atari job I must now use...shudder). The mouse and computer do NOT work together. Along with this problem I noticed a screen flicker...I didn't connect the 2 problems until I tried running a program off disk, without the HD up at all. The flickering, which I have since noticed becomes worse during HD access, disappeared...and the beetle mouse works!!! Does anyone know what could be causing the HD to interfere with both video AND mouse functioning? Also, why with just the newer mouse (which has run since last christmas with the HD okay? Any ideas or suggestions would be much appreciated. While the flicker is annoying, it does not affect use of ANY software.

4486. Floppy power cable help needed

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-06 03:15:59 UTC
From: cjohnson@tartarus.uwa.edu.au
Message-ID: <26ea1f$f4o@uniwa.uwa.edu.au>
Source record: 36976

Hello world,

I recently gained a non-working Atari STf, and I'm trying to get it working.

I've sus'd most things out, but I don't know which way round the floppy power cable is soldered into the board.

I assume it goes into the board just to the right of the power supply, but I can't tell which way to put it in, and I don't feel like giving the floppy 12v when it's expecting 5.

Any help would be great.

Thanx in advance,

Chris.

From: winters@access.digex.net
Message-ID: <26ee9c$dtj@access.digex.net>
Source record: 36982

I got hold of an old Supra Drive Atari Hard Disk 30MB that crashed
a few years ago. The Supra Drive Hard Disk Utilities program
(written about 1986) will not format drive, due to "too many bad
sectors". The person who gave me the drive said that there is probably
not more than 5 to 10% bad sectors on this disk. Is there any PD
software out there that can handle this MFM Seagate drive that is
in the Supra Drive case I have. It is an ancient huge looking box!!
I suppose the best thing to do, obviously, is to throw the
drive away and screw in another one, but I am curious to see if
I can salvage this thing! :--) I saw a bunch of PD programs out on
the net, but don't have the foggiest to which one (if any) might
work. If I have to, might try writing program to do this, but first
I want to see if anyone has ran into this before. Thanks for any advice
you can give me, since I am really excited to being close to having a
hard drive (so I can run Minix, which I also just got - looks slick!!)

Hi,

I'm very sorry to tell you that this is a misfeature of the Atari UUCICO that
cannot -- to the best of my knowledge -- be circumvented. Since I do not have
a copy of the UUCICO sources, I can't really do anything about it. As soon
as the person maintaining the UUCICO itself breaks down this barrier, I'd
be very happy do adapt Hermes to access this new feature.

I remember that the compiler uses a2 and d2 as being not corrupted during
subroutines, so it would be a good idea to leave them out or to save them
on the stack and restore them later.
Maybe youwant to get this info directly from gcc, so compile a file with
some functions in it with the -S (capital-S) to produce assembly output
of the file. Then look at the moveml instructions at the beginning and at
the end of the functions; these should contain the saved list of registers.

Hope this helps
Ulrich

Are you sure that these SIMMs are 8 bit wide and not 16? This would make much more sense, because (at least what I know of) you can buy ram chips only with 1 or 4 mbit (note: bits!) which is due to the multiplexing of address lines.

4495. GCC memory requirements

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-06 18:54:58 UTC
From: sourada@iastate.edu
Message-ID: <sourada.747341698@du248-15.cc.iastate.edu>
Source record: 36986

(Not again! :-)

Is it still possible (with 2.4.x, etc.) to make something as big as GCC itself on a 4MB ST (with lots of hard drive space)?

I've been having trouble getting even fairly small stuff to compile (I had to do a few things by hand when compiling MiNT, for example, because I ran out of memory with make in there...) Am I doing something wrong, and/or is there a way to make the various utilities involved use less memory?

Thanks,
Steven Ourada

Its basically the same as doing a normal device driver only you don't need to TSR and if you return a DEVDRV != 1L the kernel installs it for rather than needing to Dcntl(). I updated Dave Gymer's (now gone Linuxing) to do this if you're interested (as a precursor to a SCSI.XDD which I now, sort of, have).

>pipe at the same time.

Have a look at the tfork() function in the MiNT-gcc library (if you don't want to download the whole library to see this function, let me know and I'll send it to you.

The tfork() function will create a new thread of the currently running program, and begin execution at a specified function address.

Also, if a child created by Pfork() then Pexec()'s another program, the parent process will wake up. You can preserve a file handle across the Pexec() by using Fcntl() to clear that descriptor's close-on-exec flag. If the child then knows what descriptor was opened (perhaps passed to it in a command line parameter from the parent) it can read and write the pipe and communicate with the parent.

Good luck...

It also has a problem if run through a large screen (seems to write directly to
the screen so the command line remains in exactly the same place).
Mind you i'ved aliased the mem command to a little pd memory utility so it runs
that instead.

Macs can use 2M SIMMS, which are advertised in the Mac magazines.

: St> every Mac can handle those 2MB SIMMs.)

: The RAM Gizmo will not handle 2MB SIMMs. The reason is quite simple. The only
: 2MB SIMMs in existence that I am aware of are all 32, 36, or 40 bit wide 72 pin
: SIMMs, and about the only thing at this point that uses them is the MAC and
: some workstations. The RAM Gizmo is designed to use industry standard,
: buy-em-anywhere, 8 or 9 bit wide 30 pin SIMMs, which are widely used in IBM PC
: compatible machines, and also the Atari STe machines.

Argh!

Chris, there are 256K, 512K, 1MB, 2MB, 4MB, 8MB and 16MB 30-pin SIMMs.
The newer Macs which use 30 pin SIMMs (like the IIci, IIsi) support all
of these.

The 72 pin SIMMs were first widely used for IBM PS/2s and the like, and
are really catching on in the PC clone and Mac market. Major PC clone
manufacturers have used them for a while. Sun also switched from 30 pin
about a year ago. I wouldn't say the "only" thing that uses them are
Macs and "some" workstations...

i found "my error". if you put the option -P (absolute calls) in the PureC .prj file the Mint will work correctly. unfortunately the compiler and linker didn't mark this error.

by the way, could someone mail my an aes-falcon (v>4.00) and the mint-config.-cpx, because i got an "old" Falcon030 (4mb/65mb hd, without Mint and Speedo)

thanks

4503. Concordance.PRG?

I'm in urgent need of a concordance program that will run on both the ST and the TT. It has to be able to treat large (very large, indeed) text files.

Thus my question: Is there such a beast available out there in the PD/SW world?

Any suggestions and/or addresses to possible FTP-sites would be most welcome?

Are the calls documented anywhere, like Atari's DocSupport packages?

As an aside, how do you tell if Speedo is running and not FSM? The
vq_vgdos() call returns the same value for both. I've noticed that the
'FSMC' cookie value points at '_SPD' for Speedo - is this a good test?

Hi!

Does anybody know if there is a utility available that converts
GNU C object files to standard DRI format?

Or an utility that converts the GAS assembler output to standard
Motorola assembler?

Thanks in advance,

Greetings, Martin.

Source record: 36855

Hello World,

For a while I have been using MiNT (0.96, 1.04, 1.08) and GCC 2.3.3pl2 with MntLibs34 and have noticed that when a program writes a lot of stuff on a line the cursor does not wrap onto the next. ie

```
#include "stdio.h"
int main()
{
int a;
for (a = 0; a < 85; a++) printf("%d", a%10);
printf("\n");
return(0);
}
```

prints up
12345678901234567890123456789012345678901234567890123456789012345678901234567894
not
123456789012345678901234567890123456789012345678901234567890123456789012345678901234

Am I doing anything silly, or should it do this :-)

Another question:
Has anybody got a working version of the rg program to run gem programs from tcsh (I can't get it to work).

Another question (again):
Is there a working version of the ramfs ramdisk for MiNT, the version I have seems to very quickly run out of memory when copying files into it (even from the desktop).

[I have a 4Mb STe - not sure of the TOS version, 1.6?]

Any responses also by mail please, as I don't often get the chance to read the news.

Andrew.

4510. non modal dialogs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-07 16:01:06 UTC
From: randyh@sad.hp.com
Message-ID: <CCzr5v.H6z@srgenprp.sr.hp.com>
Source record: 36877

Hello all,

I'm interested in how to write non-modal dialogs (multitos friendly).
I'm thinking that you make a window, do an obj_draw() of your tree centered
in the window and then do your own form_do using evnt_multi? Even if this
is correct I'm still a bit wanting on the actual mechanics. I've never
even done a dialog that was not canned, using form-alerts and the great
stuff Ian Lapore did in gemfast 1.8. So if anyone has any code they would
like to send me I would really appreciate it. I am using Heat and Serve C
but code wrtten for another compiler would also be fine.

Thanks, Randy

The VT52 emulator in TOS (and consequently MiNT) defaults to no line wrap. If
you want to turn wrap on, print ESC v. I either put ESC v in a text file and
cat it, or run this program:

[Inline uuencoded payload not displayed: wrapon.tos]

Where can Mint 1.08 sources be found on internet? I may have missed the info (sorry). I assume these, like 1.04 was, are compilable with PureC.

Also, I am having difficulty with the Signal handler fuction Psignal. Although I can pass the address of my routine to mint, when a signal comes in, the requested routine is not executed, instead the program aborts.

Thanks.. "MICRO"

The VT52 emulator can be set to a "wrap at end of line" mode by printing
Esc-v and to a "discard end of line" mode by printing Esc-w. I think
when the ST wakes up, the console is in the "discard" mode, so to get
the wrap around behavior, you could insert 'printf("\033v");' somewhere
before printing that long line.

Not to beat a dead horse, but SIMMs are available in 1, 2, 4, 8, 16 and 32 Mb sizes. I haven't seen a 64Mb SIMM just yet, but I hear they are (or soon will be) available for those who have the cash. I myself just bought a single 8Mb SIMM for a Mac.

80 ns RAMs + a 16 MHz CPU wouldn't help much since the rest of the logic is too slow. Please also consider that the ST's ram is actually running and accessible with the speed of a 16 MHz 68000. So the CPU and the video logics can access the ram in a time multiplexed way without the need of wait cycles. (The macs of that time did multiplex with one wait cycle, din't they?)
I wouldn't touch this part of the ST's logic.

If You were in Germany, I would offer You a used 16 MHz 68000 based accelerator with 8 k of cache for a good price (i upgraded to a 68030/68881 a while ago).

GCC uses all available registers. You cannot rely on anything except that
d0/d1 (and, as far as i remember, also a0/a1) need not be saved, since these
reggies are used to return results of a function. You might check
the math lib code for the memory mapped 68881 board which i contributed a while
ago to the distribution. I forgot the details since a switched to a sparc clone a
while ago.

Hope that helps

Source record: 36864

gnu.o -> dri executable can be done with gcc-ld. But dri.o and dri.exe differ :-(

A solution might be "disassembling" the gnu objects, eventually formally as a large bunch of words, and reassembling that with a dri compatible assembler.

Only practical if You have to convert a few files, see below. Well, and You lose the symbol table and thus cannot use global variables. It worked for me when i ported my 68881-lib from gcc to a different compiler.

If You can live with such restrictions: it should be possible to use gdb/gas for the opposite direction (i didn't try).

I did that successfully and used Heimsoeth/Borlands MAS/BUG. But there exist both assemblers and disassemblers in the PD (assembler: e.g. that of sozobon c; disassembler: i have a very old pd disassebler for the plain 68000 lying around, unfortunately a purely interactive .TOS application. I did not try dirty tricks like popen'ing to it.)

I've got and Atari-made TT-RAM expansion board which has 4 SIMM slots and came with 4 1-meg SIMMs. I've been told by some people (who were just guessing) that this board requires four of the same type SIMMs, so if I want to expand it I need to get four 4-meg SIMMs and throw all the 1-meg ones away. Is this true, or could I put, say, one or two 4-meg SIMMs in and leave the rest at 1-meg, giving me 7 or 10 megs on the board?

Also, does would it be possible to put 16-meg SIMMs on the board?

Also again, there's some jumper-switches on the board--would they need to be changed (and if so, how?) if the SIMMs are changed?

-thanks

From: wilsont@rahul.net
Message-ID: <CD0A8A.EH5@rahul.net>
Source record: 36865

After trying about 15 different line lengths for dvi2tty.ttp converting
lib-card.dvi, i gave up.

Can someone point me to another dvi->ascii converter?
or, how do I get the TeX files to 80coulum ascii without the whole
TeX package?

Source record: 36875

Hello,

Currently I'm trying to get Taylor UUCP under Mint to work (anyone made it
yet?) and I need a PASSWD file in \ETC. Anyone know what that should
contain?
And what shell works nice under MTOS?
Any tips/hints/advices ('I'd stop right there if I were you') welcome!

Thanks,

Paul

4524. TT Serial Ports

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-08 00:50:36 UTC
From: ktessner@sanity.tdkcs.waterloo.on.ca
Message-ID: <H.ea.Jg00vtAcla6@sanity.tdkcs.waterloo.on.ca>
Source record: 36878

Okay guys, I'm writing a term program for the ST, but it would be nice for it to support the TT/Mega STE (Falcon???) as well, and I am wondering about accessing the other serial ports. I know that the Serial1 port is driven by another MFP chip, and the address, but I'm wondering if it has access to critical signals like RTS/CTS and DTR... I didn't find the CTS on the MFP bit where it is for modem1, and the other two I have no clue where to look for. If anyone has a summary of how these signals are addressed and where, I'd really appreciate it. Modem2 and Serial2 I'm already getting info on, so I'm really just after the serial1 stuff. Thanks

there is a toolkit associated with the GNU linker et.al called BFD (binary
file descriptor). BFD is used to read and write different format object files.
snag a copy of GAS from prep.ai.mit.edu:/pub/gnu to get a copy of BFD

which reminds me, do the folks producing the ST ports of GCC do it via BFD?

Pardon my ignorance, but I have never written a device driver
properly, only that installs itself as a TSR and does lots of
naughty things that MiNT doesn't know about. If you please
the source would be most helpful.

Well you can try GER2EN30.LZH. Its available on atari.archive.umich.edu
on applications/other or something like that.
GER2EN30 is free. You can use it as much as you want. If you want
CV-Translator v1.0 (German, Dutch, Spanish, French, Italian, Portuguese
--> English) you've to send $US20. The address is in the program.
You can also reach the author on carlos_varela@pleiades.org or .com .

Good Luck.

I checked today, discovered I hadn't actually done it (i'd just hacked it
into my SCSI code), but backed it back into ps0.c; I'll grab it out of the
office tomorrow & put it up on a.a.u.e.

4533. XACC/Gl. Readable Mem.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-09 07:07:32 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.w&ZJ8kHOsqg@elfhaven.ersys.edmonton.ab.ca>
Source record: 36815

Hi,

I have been reading about the XACC-Protocol, and it mentions that when you pass your application message (when you start your program) that you have to pass a string. Then it says that the string you pass has to be in global-readable memory.

How do I do this? That's one thing it doesn't say...:)

One person suggested that I needed to use Mxalloc(), but my library (dLibs) does not seem to have that call. Is there something I am missing?

This also raises another question. Do I have to do the same thing with operating system calls like mn_title() (this may not be the correct name; it is a function that allows you to change the strings in the menu entries of your resources)?

I do not think that the second is likely, since all previously written applications which did this would then crash. Right?

Please respond by E-Mail, and I will summarize the responses (since this may be a topic of general interest to other readers of this newsgroup).

As it so happens, I have done this. The mechanism you describe is
correct, but it is a bit more complicated. Using evnt_multi you will
need to adjust a.o. the resource ob_x and ob_y values to move the dialog
too after a WM_MOVED message. If you get a mous click from evnt_multi
you will need to do an objc_get to find out which object was below the
mouse pointer and then simulate e.g. the edit functions of edit objects.
Quite a bit so to say. Luckily there are libraries that do this for you.
Unfortunately there are none to my knowledge for H&S C. I use H&S C too
and have just (yesterday evening) translated a Pure C wniddial lib to
H&S C. Once I have tested this lib I will put it up for download on some
site (probably ftp.cs.ruu.nl, I'll announce it in advance).
If someone has a working ar for creating H&S C libs I would be most
grateful. At the moment I would only be able to ditribute the lib as an
object file.

Erlend.

Don't worry, TOS 1.4 is very stable. Use the patches Atari provides.
Then change the poolfix program for poolfix92 which is a bit better.
Then add a good serialfix program like serialfix 1.1 or hsfix1.4
Accent 2.06 is nice too if you want to be able to type extended asci
characters, especially foreign characters.
That is about it.

Erlend.

Both of it: Have you ever read a table with VT52-sequences? One of them
activates, another one de-activates the auto-line-wrap, what means the
automatic line-break after a line becomes too long. I could look after it,
but I'm not at home near my ST.

Paul_Tuijnman@p2123.f130.n500.z2.fidonet wrote:
: Hello,

: Currently I'm trying to get Taylor UUCP under Mint to work (anyone made it
: yet?)

yep !
Taylor 1.04 works fine here on my ST running MiNT 1.08 and MINIXFS.
I compiled it without bigger problems using gcc2.33 and MintLibs PL34.

: and I need a PASSWD file in \ETC. Anyone know what that should
: contain?

It' just a "normal" passwd file as on most *IX machines.
format:
<user>:<crypted password>:<UID>:<GID>:<username>:<dir>:<startup-program>

an entry for uucp should look like:
uucp:*:5:5:Mr.UUCP:/usr/lib/uucp:/usr/lib/uucp/uucico

this would result in execution of uucico, as soon as someone logs
in as uucp.
But remember, that Taylor uses it's own passwd file in "newconfigdir"
Here is a passwd file fromm the "sample" directory of the original
Taylor 1.04 Sources:

-------

# This is an example of passwd, the call in password file for Taylor
# UUCP. To use it, you must compile the package with
# HAVE_TAYLOR_CONFIG set to 1 in policy.h (that is the default), copy
# this file to newconfigdir as set in Makefile.in (the default is
# /usr/local/conf/uucp), and edit it as appropriate for your system.

# Everything after a '#' character is a comment. To uncomment any of
# the sample lines below, just delete the '#'.

# This file is used when uucico is invoked with the -l or -e argument.
# uucico will then prompt for a login name and password. The login
# name is looked up in this file to check the password (the system
# password file, /etc/passwd, is not checked). This permits uucico to
# completely take over a port, allowing UUCP access to remote systems
# but not permitting remote users to actually log in to the system.

# The format is just login-name password.
Uairs foobar

-----
```

: And what shell works nice under MTOS?
i had no problems with "ash" and "bash", although the bash needs a lot
of memory.

: Any tips/hints/advices ('I'd stop right there if I were you') welcome!

At the moment, i'm in my office and cannot look for the changes i had
to do for compiling Taylor, so i try to remember the most important things:
- watch out for the "mode" parameter in fopen. I changed all modes to
binary ("r" becomes "rb", "w" becomes "wb" and "a" becomes "ab")
but i think this can also be done using correct information in the
UNIXMODE enviroment variable.
- use BSD tty handling. I only had problems with the TIOCNOTTY settings,
causing my modem not to answer anymore.
- there was a definition missing for , i think ist was ENOENT, but i'm
not sure. You'll see during compilation :-)
- In the beginning the UUXQT had some problems in unlinking the L.* files
in the SPOOLDIR. After changing SPOOLDIT to V2, these problems were gone.
So, if you prefer another SPOOLDIR type, expect the problem mentioned
above

hmmm, Guess that's all. Hope it helps.
Anyway, please let me know if you have it running.

: Thanks,
you're welcome !
: Paul

Hi there!

I'm looking for the last version of elvis (vi-clone) for
atari. The last version i have seen is elvis16 beta dated
16. Nov 1992.
Since there is a version 17 available (on PC) i'm wondering if
someone has ported this to the st?

>contain?

It's identicle to the BSD Unix passwd format, ie.

username:encrypted password:uid:gid:GCOS:home dir:shell

>And what shell works nice under MTOS?

Erm, what shell do you want?

There's Ash (Bourne shell reimplementation), tcsh, ksh... etc etc etc

>Any tips/hints/advices ('I'd stop right there if I were you') welcome!

May I suggest you get a copy of my init package. I know it hasn't got a
version of cron but it should have everything else you need (init, getty,
login, syslog, passwd etc etc etc).

At the moment the latest release does have a bug in login and su which will
be fixed in the next release. Also, it's a source only release until such
time as I have the time to write an installer program.

My init(8) package can be found on atari.archive in
atari/Mint/Utilities/inisrc11.tgz. It's a gzipped tar archive. You'll need a
Minix partition to extract it and build it.

The opposite is possible; look on atari.archive for dri2gnu.* (or

> Or an utility that converts the GAS assembler output to standard
> Motorola assembler?

Again, look on atari.archive for a (recent) program called mit2mot.* (or
something like that).

I found a program on atari.archive called 'detex.ttp' (sorry, I'm not
sure what the archive name would be) that just strips all TeX formatting,
leaving you with the plain text. If you can't find it, I'll email it
to you (it's very small).

You got it. The main difficulty is that the whole program should only use
one evnt_multi that is setup in a way that will handle all types of events
and form handling.
The worst part is editable objects...

Well, just to be more exact: "Standard" SIMMs are 8 (or 9) bit wide, thus
cannot be 2 MB (see above). 72 pin SIMMs are 32 (or 36) bit wide, and cannot be
2 MB either.

IF there are 16 bit SIMMs around, they truly CAN be 2 MB.

4549. Falcon Video Connector Help & Some Tips

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-10 00:37:03 UTC
From: scotty@verdix.com
Message-ID: <1993Sep10.003703.29553@verdix.com>
Source record: 36794
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello fellow netters...

Please help me with the following request if you get a chance. Afterwards I will share some possibly useful information regarding getting the Falcon squared away.

I'd like to adapt my Falcon's VGA video connector plug so that it will allow my multisync monitor to display true color mode. Unfortunately it programs the Falcon to think that I have a VGA monitor, which disables the true color mode in the "set video" dialog.

I believe this is done using the pins M0 and M1 on the video connector. Can someone please tell me how these pins are connected for VGA and for an Atari Monitor adapter?

Toad Computers is planning on selling a switchable adapter, but they have no idea when it will be available just now...

Here are some possibly useful tips I have extracted on setting up the Falcon030:

1. My Falcon's internal IDE drive had the dreaded spin-up, spin-down problem when I first took it home. It was obvious from the sound it makes when the room is relatively quiet; the drive also seems to take forever booting up and loading certain programs (alas, Nethack was a good test).

My dealer had no information on how to fix the problem; they said that some of the 65 Meg drives on earlier units had been replaced, but none of the machines with Conner 84 Meg drives had the problem. They recommended that I call Atari, which I did.

The Atari Rep I spoke to was unusually helpful. He said that a metal shield had been installed incorrectly on the left side of the IDE drive, and that it needed to be moved to the right side of the drive in order to make proper contact with the top shield.

This shield is a bent piece of metal (ie. spring) which compresses when the top shield is put in place. The orientation of the bend (to the left) must remain the same when the shield is moved to the right side of the drive. This is important, because otherwise the speaker won't fit anymore.

I had this fix done, and the problem is all gone! Booting takes 10 seconds or so now, where it used to take a few minutes sometimes.

2. Having trouble setting up GCC on your Falcon? I sure did! Some of the programs I was trying to use just wouldn't work. If you're going to use the TOS filesystem, here's a combination I found useable:

BASH 1.10, GNU Executables ver. 2.4.1, Gnu Libs & Includes ver "93", G++ Libs and includes ver. 20. Compiler.h has the number of streams specified, but this is determined in stdio.h; comment out the #define in compiler.h and you're in business. You don't have to guess: GCC-CC1P(LUS) will point out

history saves. Since the TOS filesystem shortens both of these to .BAS, I made my ~/.bashrc (.BAS) read-only. This sacrifices .bash-history; there's probably a better way to do this on a TOS filesystem, but it works.

Lastly, all of the command files in /BIN need to have their .TTP or .TOS extensions removed for BASH. Without this renaming, you'll either have to type ls.ttp to get your directory, or alias all of the names with exten-sions to those without (yech)!

3. This one is of interest to those who have LQ800 compatible graphics printers. My 24 pin Epson ActionPrinter L-1000 is one. Try the following Speedo GDOS printer drivers, in this order: LQ570, NEC P-Series, and the Star NB-24 driver. My printer requires the NB-24 driver because it can only handle 180x180 graphics mode. The first two drivers use 360x360 DPI. I got this from the Atari Rep as well. Thanks!

Well, hope these hints help some of those who bother to read this far. And thanks again to anyone who can help me with that video connector!

gcc-ld takes a bunch of .o's in gnu-aout format and puts out a
DRI format executable, but i dont think this is what you were asking
for.

> >>Or an utility that converts the GAS assembler output to standard
> >>Motorola assembler?
> >

yes, there are perl scripts that go both ways, GAS <-> Moto
assembler. they should be on A.A, or i should be able to dig them up.
Both the scripts do most of the job, but do get confused sometimes.
Compiler generated asm usually they handle quite well.

> >Well.... I would like something to do it the other way, ie convert dri format
> >files to gnu objects... is there such a beast?
> >
> >Please reply via mail, as I don't often get the chance to read the groups.

yes, there is a thing called gst2gnu on A.A that will do this.
Sorry mail to you seemed to bounce earlier so i am posting.

> there is a toolkit associated with the GNU linker et.al called BFD (binary
> file descriptor). BFD is used to read and write different format object files.

no. its not easy to describe the DRI format to BFD.

currently gcc-ld is a (horrible) hack :-)

cheers,

> and easy??

I don't know about patches but I would back up your HD if you have one, I have heard of people losing all the data on their HD after installing the new TOS version. This is possibly due to the new non-BGM partition size increase from 16mb to 32mb in TOS 1.04 and
above.

From: cwood@gst-soft.demon.co.uk
Message-ID: <1993Sep10.112954.1@gst-soft.demon.co.uk>
Source record: 36820

I want to install my own TRAP handler, and would like to use the XBRA stuff to install it. If such a description could be fitted into an email message I would be grateful if someone could help me. Apart from the installing, once installed I presume that once the TRAP is called and control is redirected to my handler, I am in Supervisor Mode, and hence do not have normal access to the User stack where my parameters are. Do I have move the USP to the SSP and put it back again later, so that I can access the parameters, or is all that transparent and part of XBRA? Or am I talking absolute rubbish, and completely got the wrong end of the stick?

Cheers.

That are the normal ones, but it is not impossible to build 2MBit DRAMs.
And it is absolutely no problem to put the double number of nornmal DRAMs
plus a little decoder logic on a single *8 or *9 SIMM to get a 2M SIMM. I
haven't seen this yet, but that does not mean that they do not exist.

4559. MiNT (finally :-}

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-11 04:36:31 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1451@usdtsg.DaytonOH.NCR.COM>
Source record: 36801

Well, I have a couple questions regarding compiling Mint 1.08 (nope, not the same questions as before - since I finally got it to compile!!!). Anyways, my questions are based on doing this:

-I took the MNTLIB34 as my mintlibs, and also made copies of the m* files (like miio.olb) with the Gnu names (i.e. I have the same file called GNU.OLB and MINT.OLB, etc). Was this a reasonable thing to do, or would would recommend a different setup than that? (I did this since I was having some difficulty with -mint etc)...

-there are two programs apparently being called from the "makefile" that I don't seem to have: PRGFLAGS and STRIP - what do these programs do, and where could I find them if I need them? I simply commented them out from the makefile...

-is there *any* way to get Mint and Warp9 working nicely together (faster screen updates would be fast, and since I already have Warp9, I'd like to try to stay that route -otherwise maybe I'd go for NVDI)...

-I compiled Mint with both GCC 2.3.3 and 2.4.2 (I think the latter is the right number); anyways I noticed that 2.4.2 produces a slightly larger mint.prg file (by about 20k) - just curious why; I may try using the latest version of GCC (2.4.5?) and see what that does

-I think some of the problems I had along the way had to do with having my LIB files mixed and matched (don't ask how - I can't remember, I just deleted them and unarchived only certain ones) - thought that may help someone maybe...

--well, so far, I have Mint 1.08 loaded in with a number of other things (including ConNect at the moment) and everything seems to be working ok so far (at least as good as when I'd have 0.95 in); to yunz unix gurus compiling the source may be commonplace (?) but I feel like I've accomplished something (then again, I feel I've accomplished something when I drag myself out of bed :-) speaking of which, it's getting late...

--I did all my compiling on Minix partitions - would I have had the same successes/failures if I had used a TOS partition? just curious (minix partitions are cool - but why do they limit filenames to like 15 characters?)

...well, if anyone has any answers/comments to some of my questions it'd be appreciated (and yet another thanks to the numerous folks who've helped me so far :-)

4560. TT-quantum PROBLEM ???

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-11 06:49:46 UTC
From: mluoto@klaava.Helsinki.FI
Message-ID: <26rsea$4gg@klaava.Helsinki.FI>
Source record: 36802

Hello there,
Here's a nice deb time story a la ATARI that's about to
drive me nuts !!! I bought a Quantum Pro Drive 170S awhile ago to
replace my little 48meg seagte (the internal drive in my TT) ....

Then when I installed it the fun started: the computer would not
acnowledge it... when with syquest ???

so get this: I've got two places for scsi-devices (currently) one
intern, (that means the box beside motherboard etc) wich has flat-cable
and is connected to TT's main power source and then I have one external
that has a cable coming from TT's back panel and a separate power source
!

The deal is that both drives work fine if syquest(44mb removable) is
connected as intern (scsi-addres = 0) and quantum as extern (scsi-addres
= 1)..... also both drives do work fine if only one of them is connected
in either intern or extern place with scsi-addr = 0 ... but if I put
quantum as intern (scsi-id = 0) and syquest as extern (scsi-id = 1) the
TT doesn't recognize the quantum... but does find and boot the syquest
???

also all combinations of such where the intern drive would have scsi-id
other than 0 don't work....

so what am I to do ? hook the intern drive with another cable from TT's
back panel ???

Guru's Please... !

Check inside your TT close to the external DB25 that you have the terminating
resistor packs fitted; my (admittely _very_ early developer TT) didn't and no
way would any SCSI work realiably with anything attached to the outside
world until they were fitted.

Strip just strips the symbol table out of the binary, so you gain a little
disk space. prgflags is a program that lets you set some flags which are
interpreted by the loader when a program is started. I remember that the
makefile for mint 1.07 did something like
prgflags 7 7 mint.prg
where the first arg is a mask. The bits mean, that mint gets loaded into
TT ram, mallocs from TT ram and something I dont remember :-)
(These things could be wrong, so please correct me if they are).

> --I did all my compiling on Minix partitions - would I have had the same

> partitions are cool - but why do they limit filenames to like 15 characters?)

This limit is introduced by the time you set up the partition via minit.
It has a feature to choose the max. name length (I think it is the -n option)
to be 2^n-2 but this has to be lower than a certain limit about which exact
value I am not sure at the moment, but it is said something about it in the
docs.

4564. MultiTOS problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-11 15:50:58 UTC
From: michael@tapestry
Message-ID: <26ss52INNk83@ymir.cs.umass.edu>
Source record: 36805
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just bought MultiTOS and so far I haven't been able to install it. To avoid collisions with other software, I configured my system not to boot with other auto programs or accessories (except Xboot, although I can't see why that one would introduce problems). When I double-click on the install program, it creates a window with a title and just hangs, never even filling in the contents of the window.

My machine is a Mega 2 upgraded to 4 megs on the motherboard, hard-drive software is ICD version 5.1.0. I also have a JRI genlock (supposed to be invisible to software) and an AT-Speed card installed.

Has anyone had a similar problem or any idea what might be wrong? I backed up the installation disk without any problems, so at first glance it doesn't seem like a faulty disk.

Thanks for any information.

It'd be really fantastic if someone with a working Taylor UUCP setup could
post a really detailed description of their system setup... I've never seen
a hints & tips for getting it to work on an Atari machine.

> And what shell works nice under MTOS?
> Any tips/hints/advices ('I'd stop right there if I were you') welcome!

tcsh works really great; if you like bash and ksh, there are also ports
of those available.

4567. ConNect and cursors

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-12 02:12:25 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1453@usdtsg.DaytonOH.NCR.COM>
Source record: 36808

When I upgraded to ConNect 2.20, I noticed when I tried to use VI
on the system here that the arrow cursor keys didn't seem to give the
correct results. Then I realized why - I had the cursor key setup wrong.

I mention this in case anyone else runs into this. In the Setup/Emulation
screen, make sure that you have "Appl. Cursor Keys" set instead of
"Normal Cursor Keys." Then VI and stuff will work fine!

Anyways, back to real life... (what's that? :-)

No, this change won't have any effect on people using TOS >= 1.04 instead of
older versions. It may be dangerous to use TOS 1.00 or 1.02 on drives
partitioned under TOS 1.04 or newer, instead.

My 1040STFM was incorrectly connected to a replacement power
supply and sounded like it fried itself for a few seconds... Since then
(and not suprisingly :-) when I've powered it up with a correctly wired
power supply, I've got no response from it at all, other than the power
light in the bottom left corner of the keyboard coming on.
I'm no hardware wizz, but I can wield a soldering iron and
navigate my way around a schematic, so if anyone has any suggestions as
to what is likely to have been blown, or worthwhile checking (if it
can be narrowed down - don't wworry if I have to test every single chip),
then I'd like to have a go at it myself, rather than try and find a repairer
and forking out a lot of money....
Are there any online repair guides for the st ?

James.

Yep.

GEM++ does this for the GEMformwindow class (which has GEMwindow and GEMform
as base classes). If you're into C++ and GEM, GEM++ gives this and many other
more higher level interfaces to GEM.

It actually generates objects in SunOS (Sun-3) object format. The Atari GCC ld links these into a TOS executable... if only it could keep a Sun format symbol table at the end. :-)

[Stuff deleted]
>> there is a toolkit associated with the GNU linker et.al called BFD (binary

> back again later, so that I can access the parameters, or is
> all that transparent and part of XBRA? Or am I talking
> absolute rubbish, and completely got the wrong end of the
> stick?

For XBRA, you just stick some data right in front of your entry point:

```
long xbra_magic
long prg_id
long old_pointer_value
-> entry point
```

the xbra_magic is just 'XBRA' put into a long value. Your program id should also be ascii readable, but must not start with a '_' because those are reserved for Atari.

As you have to write the lowlevel trap handler anyway in assembler (at least that is the best way) you have access to the user stack pointer by specifying usp as address register. But be sure to check if the system was in super mode before the trap, because in this case all the data is on the super stack! Better do not replace the ssp with the usp, get a pointer to the data and use ist via va_args or kind of that.

Regards,
Ulrich

Right. This is a bug in 2.20 resulting from my effords to get rid of a bug
in vt220. You can only solve this problem by entering the emulations dialog,
leavin it with OK and then saving the SETup.

Sorry about this bug - the next version (2.50 including fax and a faster
z-modem upload) will work fine again.

Wolfgang

The bare minimum for MiNT is mint.prg. To do anything with it however,
you're going to need some other programs. A realistic minimum setup
would be:

C:\auto\mint.prg
C:\toswin.acc
C:\mint\bin\mintshel.ttp
C:\mint\bin\rm.ttp
C:\mint\bin\mv.ttp
C:\mint\bin\cp.ttp
C:\mint\bin\tcsh.ttp

Which ought to come to about .5 Mb. Set your PATH variable in tcsh to
be C:\mint\bin and you'll be away. Select 'TOS programs' from the
accessory menu, and run tcsh.ttp. All should be sweetness and light.

Simon.

While I was hacking a curses library for use with H&S C, I found that the lib automatically installed 80 as the term width and 25 as the term height. I do not want this, so I am looking for a more flexible solution, that will also work when I am in 40 column mode, have installed another TOS font so I get 50 lines, or e.g. use TOSWIN and have a 128 x 43 window. How do I find out? I think that on Unix systems I need to use the termcap library, but I do not have such a thing for H&S C and neither do I have a termcap file. Nor do I want one, because everybody should be able to run my program. So how do I solve the problem? I guess there must be something in the Mintlib, but I hhave no idea where. Any help is appreciated.

Erlend.

>Then change the poolfix program for poolfix92 which is a bit better.

Has the "bugs" the author of this program claims to have fixed ever been substantiated as real? From what I recall, the author never states examples of what breaks.

One bug he claims to fixed is calling the memory pool compaction routine after Mshrink(). Is this really necessary? Certainly Alan Pratt is not perfect, but I find it hard that he would omit this if there really was a bug here.

The other "bug" he claims to fix has to do with preserving register D1. My understanding is that registers D0-D2 and A0-A2 are not preserved by GEMDOS therefore any program that breaks because D1 changes is the one with the bug, not poolfix.

I used poolfix3 for a long time and never encountered any problems with any programs.

Source record: 36755

I'm trying to make sense out of the listing at Atari Archive. Can someone out there PLEASE tell me what files I need to get in order to have a working version of GNU C? Bear in mind that I don't have ANYTHING right now, so I'll be starting from scratch. Also, does anyone know where I can get these files in FidoNet? Getting stuff from aa is a real pain for me right now.

Thanks in advance.

Later,
Gizmo

4585. What exactly does wind_update do?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-13 23:44:06 UTC
From: umcordes@ccu.umanitoba.ca
Message-ID: <CDBGLJ.Fyu@ccu.umanitoba.ca>
Source record: 36836

While programming myself a nice little personalized database program, I've come across a couple of little questions concerning the AES.

In particular, I'm curious as to when wind_update(BEG_UPDATE) should be called and what it does.

I've been tinkering around a bit and it seems to me that it might make sense (and be easier) to wind_update(BEG_UPDATE) immediately after my event_multi call. Then I could wind_update(END_UPDATE) before my next event_multi. This seems to make sense considering I do not want any menus to be popped down or any scroll bars to be moved when my program is executing a menu command, for instance. Would this be a good idea?

I guess that leads in to the following question: What exactly does the wind_update do? After doing a BEG_UPDATE, can, for example, STalker still d/l in the background? Or does a BEG_UPDATE freeze the AES completely?

Can dialog boxes still function correctly if I have called a universal BEG_UPDATE after my event_multi?

Maybe I should just use wind_update for when I am redrawing the screen? If yes, then what would I use to freeze the AES while I'm doing heavy calculations, for instance?

And to top it all off, will any of these be considered "bad" for use with Multi-TOS? (I now have TT 3.01)

One last question, are there any libraries available (or even some text documentation) on how to make & implement "non-modal" (?) dialog boxes?

Thanks to anyone who wades through my miserably organized message, and help is welcome!!! Talk later.

4586. Help: need Atari monitor info

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-14 00:49:02 UTC
From: root@ve6bc.ampr.ab.ca
Message-ID: <CDBJLr.6GA@ve6bc.ampr.ab.ca>
Source record: 36742

Greetings Atari users,

I have some simple questions that I hope one of you can answer for me. I have inherited an orphaned colour monitor that was used with some kind of Atari machine. This is all I know. The monitor is not an Atari model. Can someone give me a quick rundown on what types of monitors were/are used with Atari machines? Things like horizontal scan rates, vertical refresh rates, signal types (TTL, analog) bandwidth, dot-pitch and resolution would be very helpful.

I am trying to determine if I can press this unit into service on a PC, and if so, how.

Thanks...

You want to mess aroundto display "True Color'" on your Falcon on your VGA Monitor at 640x480? I'd be interested to know what your results are..

In VGA Mode "True Color" is only displayable at 320x480, however if I am correct, hardware converters are available to display higher resolutions on a Falcon with "True Color" eg. like Blow Up'030. In the "MS" modes it appeared to be able to have the option "True Color".

I think the highest it can go is 448x544 in the "TC" mode...anyone have more experience on Blow Up'030?

>wind_update do? After doing a BEG_UPDATE, can, for example, STalker still
>d/l in the background? Or does a BEG_UPDATE freeze the AES completely?

For all I know, wind_update(1) (that's BEG_UPDATE) tells the AES
that now you're doing some drawing on the screen. The AES will
then not do any graphics itself, i.e. it will not drop down any
menus or move any windows. It was said, I recall, that it might
be a good idea to do a wind_update(BEG_MCTRL) before updating
too, in order to prevent the AES from switching the top window
during the update. Of course, after finishing the screen update,
it is necessary to call wind_update(END_MCTRL) and
wind_update(END_UPDATE), otherwise no menus are available anymore
and no window can be moved -- the AES would appear frozen forever
to the user.
Since wind_update(BEG_UPDATE) does not freeze anything, it just
suppresses AES graphics operations, calling it should not stop
things in the background. Of course, it depends on how the
software does thing sin the background -- some may depend on all
other programs to do AES calls regularly because they rely on the
AES' cooperative multitasking capabilities.
Regarding the question about your evnt_multi() loop, I'd say it
depends on what your program does in response to the events. If
all events just cause a screen update and not any significant
computation beyond that, you could proceed as you suggested. But
if there are events that lead to possibly more time consuming
operations, I think it's not such a good idea, as it would leave
the user with a frozen screen for the duration of the compuation.
If things may take quite some time, e.g. sorting of your
database, you should consider to put some evnt_timer(0) calls in
your loops of these routines to allow for cooperative
multitasking. On single-tasking Ataris, it can be a good idea to
lock the screen to avoid jams in the AES event queue (they can be
lethal), but it's nice to entertain users with a progress bar or
some other current status report for the duration of the

computation.

>Can dialog boxes still function correctly if I have called a universal
>BEG_UPDATE after my event_multi?

I haven't tried that, but I wouldn't expect them to. To lock the
screen for dialog boxes, use form_dial(FMD_START).

>Maybe I should just use wind_update for when I am redrawing the screen?

Generally, that's the idea.

>If yes, then what would I use to freeze the AES while I'm doing heavy
>calculations, for instance?

Just do something to entertain the user and tell them what you're
doing, and at what speed. It can make a lot of difference -- as
much as the difference between going to have a cup of coffee
while your program is running vs. pressing the reset button...

>And to top it all off, will any of these be considered "bad" for use with
>Multi-TOS? (I now have TT 3.01)

Try to lock the screen as little as possible with MultiTOS. If
you still want to entertain the user, do that in a little
separate window rather than in a dialog box. From my personal
point of view, there's not that much need to entertain MultiTOS
users while doing lengthy computation because they can entertain
themselves by going ahead with other business.

4589. GCC 2.3.3: Bignum assumed to be binary bit-pattern

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-14 02:18:39 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <2739lvINNp7s@rs1.rrz.Uni-Koeln.DE>
Source record: 36839

Hi GCC gurus,

when I compile my project on my Atari TT using gcc 2.3.3 (I havent
gotten around downloading 2.4.5 yet), I get the curious message:

d:/abfall/cc230.s: 10586: Bignum assumed to be binary bit-pattern
d:/abfall/cc230.s: 10666: Bignum assumed to be binary bit-pattern

The resulting executable seems to run flawlessly, so it seems the
assumption made by the assembler (I guess it must be making it) seems to
be correct.
I wonder, though, what is it that causes this message? How could I track
it back to something in my C source code?
The code compiles withoug any complaint on unix boxes with both gcc and
other compilers, so I don't think I'm doing anything odd in my code
involuntarily.

Hello Sozobon lovers,

I need to know how to use the make program in the SOZOBON package.
I dont like using the mupfel shell, but my compiling specs. are too
complicated to enter on the short line presented after double clicking
on cc.ttp.

Usually I compile with a command similar to this:

cc -o myprog.prg myprog.c graphics.a libm.a vdifast.a aesfast.a

How do I set up a makefile to accomplish this?

Thanks in advance.

Chris.

>event_multi.

This isn't a good way to use wind_update. wind_update(BEG_UPDATE) locks the screen so that no other application (or accessory) can write to the screen, and wind_update(END_UPDATE) releases the screen to allow other applications to write again. If your program "hogs" this semaphore, other programs (under MultiTOS) or accessories (like STalker) will have trouble keeping their displays updated.

It's best to use wind_update() only in those situations where it's absolutely necessary; for example, while displaying a dialog box, and while updating windows.

You generally should *not* try to freeze the AES while your program is doing calculations, since in fact this is precisely when the user is most likely to be bored and wish to do some other work (or maybe play a game :-)).

>for the buttons to be 3D under MultiTOS? They just "invert" now. Any
>help would be appreciated.

Yes. You need to set certain bits in ob_flags for any objects you want to
make 3D. The bits are 9 and 10, and the meanings are as follows:
0x000 not a 3D object
0x200 3D indicator (e.g. a radio button)
0x400 3D background object (e.g. the background of a dialog box)
0x600 3D activator (e.g. an ordinary "OK" button)

(I could have the bits wrong, I'm working from memory: this message is
no substitute for a developer's kit :-)).

>Is there a way I can tell if there are any windows open?

In single tasking TOSes, you can wind_get(0, WF_TOP, ...). If any window
(i.e. not 0) is returned, there are windows open. If 0 is returned, the
desktop is on top. In MultiTOS however, this may not mean there are no open
windows, because there may be no top window at all. This is done to allow
keyboard events to go to an active application which has no open windows.
But if I'm right, WF_TOP returns more info under MultiTOS; I think it
also returns the second topmost window.

That's exactly how I do it most of the time. Don't know if it's good practice
though, and since I know nothing about MultiTOS, I'm not sure about
MT-consequences either...

>Can dialog boxes still function correctly if I have called a universal
>BEG_UPDATE after my event_multi?

Yes. If you had tried, you'd known.

>One last question, are there any libraries available (or even some text
>documentation) on how to make & implement "non-modal" (?) dialog boxes?

Just this week I downloaded egem_113.lzh from ftp.cs.tu-berlin.de. It's a Pure
C library (with sources!) for using flying-dials, non-modal-dials, etc. Looks
very good and very 'clean'. Only drawback is that the source isn't documented,
so it will take some time to fully understand what's going on.
If you use Pure C, the easiest way is to compile the library with debug-infos,
and then run the example-application in the debugger.

Well, it is officially bad practice under MultiTOS, but if you do move
your update calls as close to the drawing actions as possible your application
will become terribly slow. The only `nice' programs that run OK in the
Multi AES environment are programs which do not do any continuous work such
as changing mouse forms, checking rectangles, flashing the cursor, etc.

4597. Mega-STE keyboard problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-14 14:03:46 UTC
From: tapp@uvphys.phys.uvic.ca
Message-ID: <1993Sep14.210636.26195@sol.UVic.CA>
Source record: 36752

Does anybody have any idea which part is likely to be faulty in a Mega-STE keyboard when the LEFT SHIFT key generates the wrong codes in combination with certain other keys such as A, F, etc.?

All character codes are generated correctly with the RIGHT SHIFT key and most, but not all, are correct with the LEFT SHIFT key.

The problem is within the keyboard unit, because it goes away when the keyboard unit is swapped with another.

I notice that there are two chips in the keyboard unit: an HD6301 microprocessor and a 74LS244 buffer.

Thanks.

Bob Tapp, University of Victoria

From: smppolan@reading.ac.uk
Message-ID: <smppolan.748052578@reading>
Source record: 36753

Hello World,
Thanks everyone who told me about the ESC v/w thingy for wrapping the cursor.
Now a couple of other questions....

1. I have a 4mb STe with tos 1.62 and whenever I press the reset button (or CTRL-ALT-DEL), the machine does not reset immediately.. the screen goes 'fuzzy' for a bit (random data on the screen) and then 2 bombs come up. Pressing the reset button again then works (but not the CTRL-ALT-DEL). Is there a problem with tos 1.62?

2. I have Monst2.02 and since I upgraded to an STe, I have foubnd that I can't look at code in the rom (ie. looking at the long word in $118 to find the keyboard interrupt code). All I get is a * in the disassembly window. I am upgrading to DevpacST version 3 anyway, but am I doing anything wrong. (I'm sure that when I had my ST it was OK to do this).

Thanks a lot (please reply via mail as well as to the group, as I read mail far more often than this group).

Andrew.

In <2739lvINNp7s@rs1.rrz.Uni-Koeln.DE>, I wrote:

>when I compile my project on my Atari TT using gcc 2.3.3 (I havent
>gotten around downloading 2.4.5 yet), I get the curious message:

>d:/abfall/cc230.s: 10586: Bignum assumed to be binary bit-pattern
>d:/abfall/cc230.s: 10666: Bignum assumed to be binary bit-pattern
^^^^^^^^^
This is my TMPDIR, in case anyone wondered.

Well, this is not why I follow up to my own posting... I messed with the compiler flags tonight and found out that the messages (they became more in the meantime) only occur when using the -m68881 flag. Next, I generated the assembler code (gcc -S) and assembled the resulting output. And indeed, the messages were reproduced. I checked the lines, and they read:

fmoved #0x7fffffffffffffff,fp0

As I already said, I have never learned fpu code, but from my faint assembler knowledge I guess that an fpu register is initialized here. Probably to DBL_MAX? I have some auto variables initialized to that. Anyway, it seems the assembler burps because it would rather have the value represented as something like 1.19e+308 or whatever, so it should be nothing to worry about.

> program is executing a menu command, for instance. Would this be a
> good idea?

The wind_update is (supposed to be) used to stop menus and such from popping down while you're updating your window... On MultiTos, having it locked at updating most of the time is probably not a good idea, since it would disable the ability to change program...

> I guess that leads in to the following question: What exactly does
> the wind_update do? After doing a BEG_UPDATE, can, for example,
> STalker still d/l in the background? Or does a BEG_UPDATE freeze the
> AES completely?

Well, it should freeze...

> Can dialog boxes still function correctly if I have called a
> universal BEG_UPDATE after my event_multi?

Probably, since a dialog box will disable the menu ... Try it out is the best I suppose...

> Maybe I should just use wind_update for when I am redrawing the
> screen? If yes, then what would I use to freeze the AES while I'm doing
> heavy calculations, for instance?

Do you want to stop people from even accessing the menu ??? I think I would consider that quite bad, since I wouldn't be able to change to another program (in MTOS), or go in a accessory or anything...

> One last question, are there any libraries available (or even some
> text documentation) on how to make & implement "non-modal" (?) dialog
> boxes?

It really isn't that hard, if you think it could be of any use, I think I can (someway) send you RezFooler (it's a program for the Falcon I've written, but the interesting bit is the windowed diaolgs.... Assembler...

4604. Falcon HD formatting help needed...all help welcome!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-15 08:08:42 UTC
From: kendall@flammulated.owlnet.rice.edu
Message-ID: <KENDALL.93Sep15020842@flammulated.owlnet.rice.edu>
Source record: 36757

Hi! I just recently got a falcon, and am trying to format this old Western Digital 300MB SCSI drive I happen to have.

I'm using the ICD SCSI Pro utilities, and I can use IDCHECK to see the ID of the drive I want to format - it shows up as IBM 31006 (or something close to that). However, ICDFORMAT will not present the drive under the list of SCSI devices to format!!

I have also tried using the HDX that came with the Falcon, but no luck there either... it says that the drive in question is not responding when I try to format.

I remember reading that parity must be disabled to work, so could this be the problem? I tried using the ICD SCSI program to probe the drive, but the only command I can get it to respond to is the Inquery. If it is this, does anyone out there either know how to disable the parity or have Western Digitals name & address? Or is my drive most likley toast...

P.S. - It does (sometimes) spin up, so I think the drive is OK...

Thanks,
--

Hi all,

I've just read an article in alt.binaries.pictures.misc which had these few lines in it:-

> ....
> I've used a b/w real time video digitiser (from Matrox) on an Atari ST
> with VME bus extension. PAL has approx. 600 lines per picture.But as the
> digitiser uses this memory as an 512x512 array, the scanned pictures were
> only 512 times 512 (and as the normal TV picture is not quadratic shaped,
> the ratio between width and height was wrong). Additionally, the frame
> grabber had problems aligning the two frames. Therefore I've skipped
> every second horizontal line and every fourth vertical pixel. That makes
> a resolution of 384x256.........
>

I'm not particularly interested in the scanner stuff, what I want to know is there a commercially available VME bus extension that can be added to an Atari STE (or any ST for that matter) ????????

I don't care about case-cutting or doing any soldering etc as I am a 2nd year Microelectonics student !!

Please E-mail ANY information on this subject BEFORE THE END OF THIS WEEK - I will not be here after *FRIDAY* (got to go back to University).

Any E-mails will be awnsered from here or from Uni. when I get back and get an account setup (they wouldn't give me one last year - meanies !!!!!)

Thanks in advance,

Andrew.

Hi,

In the FAQ for hardware there is a section about Graphic Cards for the ST
which talks about boards from a company called Matrix Datensystem (Germany)
or Matrix GmbH but there is no address for them in the faq.

Does anyone know how I could contact them ?(preferably by english e-mail -
but a snail mail would do)

Thanks,

Martin

St's GEMDOS filesystem is compatible with PC's (MS)DOS. Just format a 3.5"
on the PC, and copy the files on it with your atari. That's all...
If these are ASCII files, no problem. If these files come from a WP prog,
both WP on the ATARI and the PC must be compatible...

If your ST is a STE or more recent, you can also format the disk on the atari.
Otherwise you'll need to use a special formater (there are many of them free/
shareware on the net) that formats in PC mode or format on the PC.

Patrice

How do I place a file on the net for public consupmtion these days?

I have developed a Motif-like GUI platform, and an icon editor layered on top of it. It's an early version, but I'm curious to hear feedback, and determine if it runs on recent equipment (I have a 1040ST).

Thanks,

John Miskinis

4612. MiNT and MEGA's ????

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-15 13:32:01 UTC
From: x740756@server1.tiuk.ti.com
Message-ID: <CDEDLE.JM2@csc.ti.com>
Source record: 36766

Hi All,

I've recieved one awnser to my previous post, "VME BUS ON AN ST ????",
from Alan Edwards. He pointed out that a MEGA has a VME bus and quite
a few other bits and pieces which make it much better than my present
STE.

It's quite possible that I could 'change' to a MEGA STE by selling my
Atari STE.
I currently have a 4Mb STE with an 80Mb quantum drive (SD driver
software from Gastiener) which is full of MiNT/GNU stuff.

Is all the MiNT etc stuff compatible with a MEGA. I know it uses
TOS 2.06 which should be okay, but I'd just like to be sure !

Similarly will my hard drive hardware/software be ok ??

Please E-mail, before Friday as I'm not going to be at this address
after then. If I get a new address (and internet access) I will post
again.

Thanks in advance

Andrew.

P.S. Does anyone know how the graphics boards, eg Crazy Dots, which use
the VME bus affect the screen memory and its start address. Do they
Provide 'new` screen memory that is mapped into the address range of
the bus, ie writing to the screen would go to the VME bus as opposed
to main memory.

I have never seen an Overscan mod that works with the STe. That model
combined two chips (Shifter and MMU?) onto one chip, and you no longer had
access to the necessary signals.

If anyone has found a solution please tell me; I would like overscan too.

The fastest and most straightforward way is to get a PC-formatted
floppy (double density) and just save (or copy) your files to it. The
ST will read/write PC floppies directly, which can then be put
directly into a PC.

(getting a little messier, if your ST has TOS 1.4 or later, then formatting
from the desktop *should* be PC compatible; there are also some programs
(like Pumpup) that will format a PC-compatible floppy as well)...

The pattern above represents IEEE NaN (Not-a-Number) and there is
no way to write it as "1.19e+308 or whatever". Saying that
I have no way to tell if a code which produced this assembler in
the first place was correct or not.

Other patterns you may have problem with inputting in "not a bit form"
include '0x7ff0000000000000', with is Infinity, and signed forms of
the above.

I can't believe how often this comes up! :-)
Format a disk on the IBM (720K) and then the ST can read/write to it as
required. Ditto the PC.

Before you go spending your money on keyboard components that might not be faulty, try the easy fixes first. Disassemble the keyboard and carefully removing the plastic overlay. With a soft eraser, carefully rub the electrical contact on the overlay that corresponds with the left shift key. Just rub it enough to clean off the oxidation a bit. Then reassemble the keyboard and try it again. I agree it does NOT sound like the culprit, but it's worth a try.

If you've got a Mega, you might want to consider SST by Gadgets by Small. It's a 68030 board, and I believe you can get it as fast as 50 MHz. Of course, if it uses the MegaBus slot (and I believe it does), you can't put in a graphics board if you want one. If I were you, and I had my heart set on a TT, I'd call around to other mail order places (Rising Star comes to mind, as do D & P Computers). If you were really desparate, you might even consider contacting Atari.

From: smppolan@reading.ac.uk
Message-ID: <smppolan.748138366@reading>
Source record: 36777

Hello again.

I got a couple of responses about the reset problem with my 4Mb STe, Tos 1.62

The stuff I run in my Auto folder (usually) is

1. wrapon.prg: Basically a CConout of ESC v to turn on wrapon
2. medrez.prg: XBIOS setscreen to set medium rez.
3. Cache150.prg: FAT/Directory caching
4. Foldr100.prg: Extra folders
5. hfsel.prg: Hisoft extended file selector
6. mintnp.prg: Mint 1.08

And I still get the problem that when I press Reset of CTTR-ALT-DEL, the #
machine resets and them bombs with 2 bombs and a further Reset works (but
not CTRL-ALT-DEL).

Hope someone can throw some light on this.

Andrew.

PS. I'm pretty sure I never had this problem before.

PPS. Re Monst2. If I set the disassembly window to $00e00030, or something
similar, all I get is * in the disassembly window.

Sorry for the uneducated guess.

>Saying that
>I have no way to tell if a code which produced this assembler in
>the first place was correct or not.

I found out where the fmoved instruction originates from. In my
math-688.h file, in the definition of the pow() function, the
instruction:

```
__asm ("fmove%.d %#0x7fffffffffffffff,%0" /* quiet NaN */
: "=f" (value)
: /* no inputs */);
```

From the context in the .s file I mentioned previously, I
concluded that the pow() function might be responsible for the
strange fpu instruction, and moreover, the messages and asm
instructions are reproduced by a minimal program:

```
#include <math.h>

void main(void)
{
(void) pow(12.3, 1.23);
}
```

when compiled with 'gcc -Wall -m68881 -c'.

The result of all this is that the NaN is obviously intended, and
unless the fmove can have undesired effects under certain
circumstances, there probably is no problem. The "Bignum" message
does not indicate any error in the C code (unless calling pow()
is considered an error ;-).

4627. 520STFM->1040 dip ram upgrade needs resistors???

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-16 01:27:17 UTC
From: ocia@tekig5.pen.tek.com
Message-ID: <11506@tekig7.PEN.TEK.COM>
Source record: 36780
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I was told by one source that if I found empty pads (to drop 256k x 1 dip ram into) in a 520STFM that I would also need to add some series resistors to make the ram upgrade work. Another person disagreed.

Has someone actually personally really done such an upgrade themselves and can state whether there are some resistors involved or not? I am assuming that these might be series resistors to reduce overshoot but I don't know.

While I am here, anyone have an old upgrade for a 520 they would part with?
How about a double sided floppy drive mechanism?
How about a scsi interface card? (had a deal settled but then no answer to mail)

thanks
please reply by email if at all possible

get the window size using

```
struct winsize winsize;
ioctl(0, TIOCGWINSIZ, &winsize)

rows = winsize.ws_row;
cols = winsize.ws_col;
```

to get notification of window size changes (dynamically) install a
signal handler for SIGWINCH, and in the handler you can do a ioctl
TIOCWINSIZ to get the new size.

cheers,

Thanks to all for the help with wind_update when redrawing & doing calcs.

Now I am wondering what the correct/required calls I need to make before Exec'ing another program from within my database program. One program my program calls often is a .TTP prg, which (obviously) shouldn't have a mouse cursor visible.

What I am currently doing is shutting down my menu bar, closing my windows, Graf_Mouse(M_OFF)'ing the mouse cursor and executing the program. Should I be using v_hide_c instead of Graf_Mouse? (What's the difference anyways?) Do I need to shut down the menu & windows?

I also execute a program which isn't fully GEM (no menu or standard dialogs) but uses the mouse. How should I go about preparing to exec this?

Thanks for all the help guys! My GEM books don't have any information like this in them.

4630. wind_update question #3: When writing to a file

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-16 06:24:47 UTC
From: umcordes@ccu.umanitoba.ca
Message-ID: <CDFoHB.Fq4@ccu.umanitoba.ca>
Source record: 36782

I've adopted Eric Smith's suggestion of not freezing the screen during calculations, but rather deferring user event input by a friendly message, or simply just ignoring events.

Incorporating that into my program, I have come across a variation of the problem which I think might have to be handled differently: What should I do during a file write? Wouldn't the user accidentally pulling down a menu interrupt the file write, and maybe cause problems with the write itself? Or am I just worrying again?

Also, I still am not sure about this: When my prg is doing some heavy calculations for a couple of minutes, what happens if someone pulls down a menu (since I am not freezing the screen anymore)? If someone just pulls down a menu, and DOESN'T click on an item (ie just leaves it hanging there), does my calculation still proceed in its calculations? Or does my program suspend for the duration that the menu bar is just "hanging"?

I think the right thing to do depends very much on whether you are starting
it under the normal sinle TOS or under MultiTOS (maybe also Magix?).
Under normal TOS, you inform the AES via shel_write that you intend to start a
TOS program, then start it yourself via Pexec (to pass environment and to get
the return value). Under MultiTOS, this will surely fail.
Either you can start it with Pexec, but then you have to take care about its
terminat output and input. The other possibility is to start it via a new
shel_write mode, the program is then executed under control of a terminal
emulator such as toswin. But in this case I dont know how to get the return
value.

>
Dont use v_hide_c, as this will confuse the AES! I think it is a good idea, to
do a wind_new() to shut all the windows and shut down the menu bar before
starting the program. But remember that you have to open all the windows after
returning from that program.

> I also execute a program which isn't fully GEM (no menu or standard
> dialogs) but uses the mouse. How should I go about preparing to exec this?
>
Rewrite it to use fully GEM, as this will fail under MultiTOS anyway. Sorry,
but this is simply a bad behavior of a program.

In all anonymous FTP sites, there is generally a directory that can be accessed in write mode just for this purpose. You make an archive of your package, you FTP/put it on the "incoming" (or anything like this) folder of the site of your choice, and you generally send a mail to the FTP administrator... Read the README files in the sites for more appropriate information.

The new version of BeforeDawn works very well on my system; if I load the SilkMouse mouse accelarator, it still locks up. I'll have to send a copy of this accelarator to the author to see if he can track down the problem.

I've also found that I can load more than one ACC (as long as I don't try to use XControl) under MiNT if I load The Chameleon as well. If I try to open Chameleon, GEM suffers an Address Error and dies, but the other ACCs work normally. This is _very_ weird.

Look at the screen! :-)

Sorry.

Um, if you're not running MultiTOS or WinX, you can wind_create() until
it fails; normal TOS is limited to 7 created windows. 7 - # of
wind_create()s you did will be the number of open windows. Maybe.

That's probably about the only way, and it's pretty gross.

Actually, I had this complaint, but then found the -n parameter to
minit.ttp... minit -V -P -n x drive: gives you a V2 filesystem, with
the partition protected by a 'null disk' (is that the safest?) and
x * 16 - 2 as the maximum length of a filename. I used -n 2 and now I'm
much happier!

Source record: 36789
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

i have this function read_note() that
1. throws awa anything it read s from midi port
until it hits an note ON message
2. reads note number and velocity
3. sends that note on message to midi port (to hear
the note)
4. throws anything it reads from midi port until
it hits note OFF message corresponding to note and
channel from (1).
5. playes that note off

my problem is that it sometimes rather erraticall loses
the note off in step (4). i'm prett sure my keyboard
does send it always because my sequencer (probably
a better progtram than min :-) never loses note off.

this seems to happen especially often when i play on
and off very quickly (that is release key bery quickly)
so i don't think it's a question of buffer size

anyonw has any idea what's going on?

thanks
jacob

>
The only reason that could happen is when executing the critical error
handler, because otherwise the AES will not get any CPU time (under normal TOS).
Even under Multitos the AES does not get any CPU time during file write,
because MINT does not preempt a program while ein supervisor mode; that might
change sometime, but then there will be also a mint-aware hd-driver which does
not need to get a lot of cpu time.

It depends on what your program does. If your are using MultiTOS, then you
program will not be locked up as long as it does not try to do some output
on the screen. If a menu is dropped down, basicly the screen manager calls
wind_update() itself to lock out all other screen operations.

> > put in a graphics board if you want one.

If I would be able to somehow add a graphics card and a SST, would
that result in a more powerful computer than a TT for less money? Is it
smart to invest in the TT as a new computer. I feel rather ancient with
my Mega, but I'm not sure how much support there is/will be for the TT.
From what I understand nothing Atari is making or plans to make in the
near future is as powerful as the TT. Is this right?

4643. CPP v1.04 released

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-16 17:19:13 UTC
From: dsb@duke.cs.duke.edu
Message-ID: <748199951@amazon.cs.duke.edu>
Source record: 36659
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Version 1.04 of my stand-alone C preprocessor should now be available
from atari.archive. The main bug fixes over 1.02 (and the short-lived
1.03) are:

- #undef is now handled properly.
- If cpp can't find the specified #include file, it will now properly
say so, instead of trying to open it in the last place it looked.
- The '\xhh' escape sequence was being handled completely and utterly
wrong; it now works properly.

Thanks to Andreas Schwab and Thorsten Roskowetz for pointing out most of
these bugs.

4646. Help! Transfer problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-16 18:52:46 UTC
From: alrashi@ecf.toronto.edu
Message-ID: <CDGn3y.66y@ecf.toronto.edu>
Source record: 36645

I hope someone can help me out in this little problem I have...
Okay, I have this .wav soundfile that I want to hear on my Ste.
The problem is it's 1.2 meg's and about 930K compressed!!! That makes it impossible for me to transfer onto an IBM diskette (the only transfer computers available connected to the Unix boxes here)!! I've tried zip, lharc, and compress (16bit) to try to get it down to manageable size but as above the lowest I could get it was about 930k. If I could get the size down to about 830 K I could manage (I have a program that can format Ibm disks to more than 720K). So my need is: does anyone know of a sound-file compressor (there are such things on the Amiga...haven't heard of any on the ST) or does anyone know of any other compressor better than the above ones? Argh, I could uuencode the thing into two pieces but it would be troublesome (not to mention I can't keep the uudecoded file anywhere [no HD] so I'd have to re-uudecode the file _everytime_ I want to hear it...) Help!
If however uuencoding it is it the only way to go, is there a way I can cat _without_ using a Cli? I mean, catting a file _fast_ and uudecoding it in one shot...
Argh...Help!!

Look for a TT, even a used one.

Don't go for the SST. I have nothing personal against David Small, but
he's been having some difficulties business-wise which would prevent you
from getting the support you needed with an SST board.

Get the TT, a graphics card, and lots of RAM. You'll love it.

From a-jeffbe@microsoft.com Thu Sep 16 13:02:41 1993
Date: Wed, 15 Sep 93 22:00:05 PDT
From: Jeff Beeghly <a-jeffbe@microsoft.com>
To: dud@u.washington.edu
Subject: Request

Jeff Beeghly, a friend of mine, asked me to post this for him. Any help
is appreciated! You can reply to me and I'll forward it to him, or
(preferrabley) you can send it directly to him at <a-jeffbe@microsoft.com>.

Dan

I'm currently using GNU C (not GNU C++) for my development. I have two
problems and I'd appreciate some help.

1) The executable *.PRG files that are created by GNU are HUGE. I've
compiled simple GEM applications under GNU and under the Mark Williams C
compilers, and the program that was created by GNU is about 30k - 40k
larger.

2) Some of the programs that I'm creating I'd like to market. I
figured that I'd release a demo of it, and put some password protection
techniques in it. I heard that there is a utility called STRIP. From
what I understand, when I run STRIP, it will remove all of the variable
names from the program.

I'd like to use the STRIP utility in order to reduce the size of my
application, and make it more difficult to hack in to my program.

I'd like to know:
1) Is STRIP available? If so, then where? I tried looking for it but
I couldn't find it.

2) How do I use it?

e.g. lets say I have 2 C files for my application. When I compile, it
looks something like this:

```
gcc -c foo1.c
gcc -c foo2.c
gcc -o example.prg foo1.o foo2.o -lgem
```

In order to use STRIP, do I

a)
```
gcc -c -strip foo1.c
gcc -c -strip foo2.c
```

```
gcc -o example.prg foo1.o foo2.o -lgem
```

```
b)
gcc -c foo1.c
gcc -c foo2.c
gcc -strip -o example.prg foo1.o foo2.o -lgem
```

```
c)
gcc -c foo1.c
gcc -c foo2.c
gcc -o example.prg foo1.o foo2.o -lgem
strip example.prg.
```

Any help will be appreciated, but precise EXACT steps would be really, really helpful.

Thanks in advance,

Jeff

4649. WINX 2.1: how to change max # of windows?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-16 21:27:25 UTC
From: cmedley@wam.umd.edu
Message-ID: <27alnu$4ff@cville-srv.wam.umd.edu>
Source record: 36648
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just got WINX 2.1 from ftp.cs.tu-berlin.de and in all of the docs, I couldn't find any reference to how to change the maximum window limit beyond 8 (the default).

Can anyone give me some help? Please? :)

>executing a menu command, for instance. Would this be a good idea?

No, since you would block the screen for other applications.

>I guess that leads in to the following question: What exactly does the
>wind_update do? After doing a BEG_UPDATE, can, for example, STalker
>still
>d/l in the background? Or does a BEG_UPDATE freeze the AES completely?

wind_update(BEG_UPDATE) locks the screen for other applications. Using
MultiTOS, programs can inquire the state of the screen and suppress their
output while another prg draws its stuff.

>Maybe I should just use wind_update for when I am redrawing the screen?
>If yes, then what would I use to freeze the AES while I'm doing heavy
>calculations, for instance?

wind_update() must be active for:

- redrawing windows
- doing a 'classic' dialog

bye, Peter

If your ST has TOS 1.04 or newer (Desktop Info shows 1989 or newer), than just format a disk, copy your stuff onto it and stick it into the DOS machine.

If not, format the disk on the DOS box using "format a: /F:720".

One does not write to screen memory. Well behaved applications use VDI.

Besides, graphics cards do have their own memory, which might or might not be mapped to "real" memory locations.

STEs integrate GLUE and MMU into GSTMCU. So, the signal -DE is gone, and that's
the one Overscan modifies.
(Besides, later STEs have GSTMCU and BLiTTER integrated into COMBO.)

OBJECT::ATARI
/***/

Part 2 : Setting up G++ - the GNU C++ compiler.

by Warwick Allison

==========

This article describes the process for setting up the GNU C++ compiler
on an Atari ST, STe, TT, or Falcon.

First, there isn't much point continuing if your system is not up to
the task. In order to use the GNU C++ compiler, you will need at least:

4 Megabytes of RAM (2.5M may be enough for GCC alone)
5 Megabytes of free harddisk space

Next of course, you need to be able to get hold of the relevant files.
This may mean downloading them from a bulletin board, GEnie, Delphi, or
other online service, or FTPing them from an Internet archive site.

I can't help you much with finding a source, but the one I use is the
FTP site:

atari.archive.umich.edu

"cd" to the directory:

/atari/Gnustuff/Tos

Under there, you will find various subdirectories containing the files
you will need. In general, these same filenames will appear on other
on-line sources.

When getting files, make sure you get the most recent versions. The simplest
way to do this is to look at the datestamp on the file.

The files you need are:

Executables

The current version of the compiler is 2.3.3, but you also
need a number of auxiliary programs. You need:

("#" = some digit)

Tool	File	Possible archive names	Comment
compiler driver	gcc.ttp	gcc233b.zoo gcc233b#a.zoo	Also has C compiler
compiler	gcc-cc1p.ttp	gcc233b#b.zoo	Avoid: g++233.zoo
assembler	gcc-as.ttp	gcc233b.zoo gcc233b#a.zoo	(with the driver)
preprocessor	gcc-cpp.ttp	gcc233b.zoo gcc233b#a.zoo	(with the driver)
linker	gcc-ld.ttp	utlbin33.zoo utlbin##.zoo	Keep all utils!

other useful utils:
cnm.ttp, fixstk.ttp, gcc-ar.ttp, gcc-nm.ttp, gcc-size.ttp,
printstk.ttp, size68.ttp, sym-ld.ttp, toglclr.ttp, xstrip.ttp

look in directories like:

Gnustuff/Tos/Gcc
Gnustuff/Tos/G++
Gnustuff/Tos/Utils

Libraries

The compiler will be no use to you without the libraries.
GNU C/C++ library files have a ".olb" extension.

Library	File	Possible archive names	Comment
C++ library	g++.olb	gplibo15.zoo gplibo17.zoo	MATCH with headers
C, sys library	gnu.olb	libolb87.zoo	You need this too.
Runtime library	crt0.o	libolb87.zoo	You need this too.
Math library	pml.olb	pmlolb21.zoo	Maybe this too.

look in directories like:

Gnustuff/Tos/Gnulib
Gnustuff/Tos/G++
Gnustuff/Tos/Pmathlib

other useful libraries inlcude termcap.olb and curses.olb

Headers

The libraries are impossible (practically) to use without the
corresponding header files.

Header	Files	Possible archive names	Comment
C++ headers	*.h	gplibo15.zoo gplibo17.zoo	MATCH with library
C, sys headers	*.h	gcc233b#b.zoo	Needed.

Shell

It is very difficult to use GNU C++ without a CLI (command line
interpretter). Fortunately, plenty of shells are available - you
probably already have one, otherwise, try:

Shell	Files	Possible archive names	Comment
gulam	gulam.prg	
mupfel	mupfel.prg	gemini.zoo

Now, you've got a whole pile of files... now you have to put them
together in the right way.

Directories

Place the files in directories (folders) as follows:

/gnu/bin All the .ttp files
/gnu/lib All the .olb files, and crt0.o
/gnu/include/gcc All the .h files from the C packages
/gnu/include/g++ All the .h files from the C++ header package
/tmp Nothing - but GNU C++ will use this directory

Environment

In order for the GNU C++ compiler to work, you must tell it
certain information about your set-up. This is done by
using "environment variables". The relevant ones for G++ are:

PATH - A comma-separated list of directories were
executable programs are found. Your
shell will already have one set up.

GNULIB - A comma-separated list of directories were
libraries are found (olb files). Also,
the first directory in the list must
also contain the crt0.o file (runtime
code).

GNUINC - A comma-separated list of directories were
include files for GNU C and GNU C++
are found.

GXXINC - A comma-separated list of directories were
include files for GNU C++ are found. G++
looks on this path first for include files,
then looks on GNUINC.

TMP - A directory where G++ can store temporary files.
It is also a good idea to set TMPDIR and TEMP to
this directory too, as some programs use those names.

GCCEXEC - The prefix added to the commands the compiler
driver requires. For example, if your "gcc-cc1.ttp"

```
is in /gnu/bin, then this should be "/gnu/bin/gcc-",
because the compiler driver looks for "cc1".

Environment variables like PATH are set by typing:

export PATH=.,/gnu/bin,/bin

or perhaps:
PATH=.,/gnu/bin,/bin
export PATH

or perhaps:
setenv PATH .,/gnu/bin,/bin

or perhaps:
setenv PATH=.,/gnu/bin,/bin

You will just have to see what convention your shell uses.
Assuming the first, and assuming you have the directories
set-up as above, type:

export PATH=.,/gnu/bin,/bin
export GNULIB=/gnu/lib,/usr/lib
export GNUINC=/gnu/include/gcc
export GXXINC=/gnu/include/g++
export TMP=/tmp

Of course, you don't want to have to type those in every time you
turn your computer on. Therefore, you should put the lines into the
automatically read start-up file for your shell. For example:

gulam.prg reads gulam.g at start-up
mupfel.prg reads mupfel.mup at start-up

Finally, it's time to test it.

Using a text editor such as elvis (vi clone), emacs, microemacs, tempus,
etc. or even a wordprocessor that can output PLAIN ASCII, create a file
called "hello.cc", containing:

//////////////////////////////////////////////////////

#include <iostream.h>
main()
{
cout << "Hello there++" << endl;
}

//////////////////////////////////////////////////////

(The "//" bits are just comments)

Then, at your command line, type:

gcc hello.cc -o hello.tos -lg++
```

This should produce a file called "hello.tos" which when run prints:

Hello there++

And you have succeeded in installing the GNU C++ compiler.

Trouble Shooting

Of course, things never work first time.

First, make sure everything is located as described above.
Your shell should tell you if it cannot find "gcc", in which
case, your PATH variable is not set correctly.

If gcc is being found, type:

gcc -v hello.cc -o hello.tos -lg++

This makes additional information appear. Something like this:

```
gcc version 2.3.3
/gnu/bin/gcc-cpp.ttp -lang-c++ -v -D__cplusplus hello.cc /tmp/1234.i
GNU CPP version 2.3.3 (Atari ST)
/gnu/bin/gcc-cc1p.ttp /tmp/1234.i -dumpbase hello.cc -o /tmp/1234.s
GNU C++ version 2.3.3 (Atari ST) compiled by GNU C version 2.3.3.
/gnu/bin/gcc-as.ttp -o /tmp/1234.o /tmp/1234.s
/gnu/bin/gcc-ld.ttp -o hello.tos /gnu/lib/crt0.o /tmp/1234.o -lg++ -lgcc
```

(actually, it will probably print heaps more than that)

In the example above, we see that gcc.ttp runs, and it then
runs gcc-cpp.ttp (the preprocessor) on hello.cc to produce
1234.i (in the temporary directory). Then, it runs gcc-cc1p.ttp
(the compiler itself) on 1234.i to produce 1234.s (assembler
code for your program). Next, it runs gcc-as.ttp (the assembler)
on 1234.s to produce 1234.o (binary object file). Finally,
it runs gcc-ld.ttp (the link editor/loader or "linker") on 1234.o
along with crt0.o (the runtime support), gnu.olb (the system library
and g++.olb (the C++ library) which links the necessary parts of
each of them together, to produce hello.tos, which you can run.

The important thing is that each program is run correctly.

The "1234" is just some random number.

Also, the compiler (actually, the linker) may produce a file
called "compiler.err" in the directory you ran gcc from. look
at this ASCII file for additional information.

One of the most common mistakes is if the filename of your
compiler does not match the one gcc.ttp is looking for. For example,
if your compiler is named "gcc-cc1+.ttp" instead of "gcc-cc1p.ttp",
the compiler will not find it.

If the compiler reports that it cannot find a library (or crt0.o),
your GNULIB variable is incorrect.

If the compiler reports that it cannot find "iostream.h", check
that GXXINC indicates a directory containing iostream.h.

Notes about the GNU C++ compiler

The program generated by the "hello" code above might seem very large
(over 100K), but this is because it must link in many libraries in order
for iostreams to work. If you don't like large executables, there are
some simple things you can do:

1. strip the debugging data out of them, by typing:

xstrip hello.ttp

2. use the C Input/Output libraries rather than the C++ libraries
(eg. use printf("hello world\n") rather than the cout << ...)
in fact, this also makes things faster too, since the iostream
header files are quite large and take time to read in. Of course,
you are sliding back into C code then.

The GNU C++ compiler (and the other GNU compilers) have DOZENS of
optional features, from Optimization (add -O2 on command line when
compiling) to support for the 68030 and 68882 special features (-m68020
and -m68881 respectively). You can make it assume "int" is just a 16-bit
value (rather than the default 32) with -mshort.

That is about as much help as I can give for setting up the GNU C++ compiler.
It may seem like a long process, but it is not really very difficult - I have
just tried to cover as many possibilities as I could think of.

So go get those file, set it up, and you will be ready for the next articles
in this column, where you will see actual programming examples!

>From what I understand nothing Atari is making or plans to make in the
>near future is as powerful as the TT. Is this right?

If I was going to get another Atari, the TT would be strongly considered.
Look at its advantages even if there is no more support for it from Atari
(like there was some to begin with...):

o On-board SCSI. You can easily add SCSI drives.
o VME. You can add a handful of excellent graphics cards.
o LAN. You can easily network MegaSTEs and other TTs via the LAN port.
o RAM. The TT has almost unlimited RAM expansion capabilities.
You want 256megs? No problem.

Of course, there's other little things like speed, 1.44meg floppy drive,
stereo sound, and more TT users than SST users.

4658. TT clock problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-17 06:27:04 UTC
From: meulenbr@prl.philips.nl
Message-ID: <meulenbr.748247224@cstw168>
Source record: 36651

Hi,

My TT clock does not advance any more when the TT is turned off.
It does keep its time though.
Does anyone have an idea what can cause this. The TT is about 2 years
old.

My first analysis is that there is a nicd battery included which is
defective. Does someone have any idea what type of battery it is, and
where it can be found in the TT. I'm proficient enough with a soldering
iron to replace the battery, but I'd rather prefer to open the TT
only once (especially if the battery is at an odd location requiring
much disassembly).

Thanks for any info you might have!

4659. MiNT: Problems reading MIDI port with Bconin(3)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-17 08:55:07 UTC
From: djs@jet.uk
Message-ID: <1993Sep17.085507.17164@jet.uk>
Source record: 36657

I have some code which has been working for years on TOS 1.09 and 1.6, but fails under MiNT 1.04 (standard MultiTOS version) and 1.08 (built by me using Lattice C v5.5).

I have extracted the bit that fails, and put it into a test program, see below. It works OK on device 2, but not device 3 (MIDI). It also works sometimes if run under Xdebug. Failure occurs in two ways: Bconstat(3) returns -1 even though no MIDI device is connected, then Bconin(3) kills MiNT:

```
PID 18 (BTEST) stack underflow
PID 18 (BTEST) BUS ERROR: User PC=0 (base page=blah)
PID 18 (BTEST) rm-q: Unable to remove process from queue
Fatal MiNT error: Adjust debug level and hit a key...
```

The machine is then totally locked up; no keys work and the mouse pointer will not move.

Any ideas? (There is some odd code which I didn't understand in MiNT bios.c, relating to the switching of device numbers 3 and 4.) My code works under TOS, remember.

Thanks in advance for any help...

Test program source:

```
#include <dos.h>
#include <stdio.h>

main()
{
long c;
long status;

status = Bconstat(3);
printf("Bconstat(3) returned 0x%lx\n", status );
if ( status != 0 )
{
c = Bconin(3);
printf("Bconin(3) returned 0x%lx\n", c);
}
return 0;
}
```

Disassembly of btest (with some printfs removed for clarity):

```
; 1: #include <dos.h>
; 2: #include <stdio.h>
```

```
; 3:
; 4: main()

>...
>anyonw has any idea what's going on?
Either your code is losing bytes, or the ST is losing them for you. Taking
the first possibility first:

1) Your loop that is reading the bytes may be slowish, and, if the keyboard
is sending vast amounts of aftertouch data, you may lose data
due to a full input buffer (128 bytes by default, I think).

. Code your loop as tightly as possible.
. Increase the MIDI buffer size, see Iorec.
. Consider handling MIDI interrupts yourself, so
that you bypass the slow Bconstat/Bconin calls.

2) As I said above, it may also be possible that the ST is losing data
for you; the keyboard interrupt handler is so slow that it can block
out MIDI interrupts for long enough to lose bytes. This is especially
likely to happen if you wiggle the mouse when waiting for MIDI data
(the mouse is handled by the keyboard controller).

One workaround is to disable interrupts from the keyboard controller, but
this may not be ideal (not keys, mouse etc). This is the route I took
in a program that read and processed sysex dumps from a D50.

One reason that commercial MIDI software is so notoriously incompatible with
other things is that they end up having to rewrite the mouse/keyboard/MIDI
etc handlers in order to avoid the sort of problems that you are having.

It's all a real pain when you only want to write a 10-liner to do some
simple MIDI processing...

bammi@acae127.cadence.com (Jwahar R. Bammi) writes:

>to get notification of window size changes (dynamically) install a
>signal handler for SIGWINCH, and in the handler you can do a ioctl
>TIOCWINSIZ to get the new size.

Hmmm, interesting. Should the handler also do a refresh() to show the
new sized window? And whould the lib also install a handler for signal
19 (SIGCONT)? So that the screen is refreshed after a continue. Or
should the program that uses curses do this.
Also the lib currently uses Bconout for its output. Can programs
compiled with this lib still support a stdin from say the RS232?
Another question I have is that I found that the lib uses massive amount
of CPU time whil executing while(!Cconis()).
I want to replace this call with the select call but so far my
experiments have failed and select is not in man3 so maybe someone can
explain the function to me.
I have tried select(0,1L,0L,0L) to wait for input from Gemdos handle 0,
(stdin?) is that okay? At least the program crashes so I think not...
Again any help is appreciated. So far all help from the net has been
very helpful, so I have no worries for this question ;-)

Erlend.

> likley toast...
Drive is most likely 100% ok. HD quality is amazingly high. Unfortunately it's very likely (95%?) the drive may have _hard-wired_ the partity check if you cannot get it to work despite correct configuration of jumpers etc.

Western Digital Support, if you want it, is (714) 932 4900, 24h touchtone automated, but during business hours (California time) you can work your way to a human techie, eventually :-) /* They like classical music */

Otherwise see my previous mail for a longer monologue on this problem.

Kendall Helmstetter hacked the following on 15 Sep 93 (to All)...
> From: kendall@flammulated.owlnet.rice.edu (Kendall Helmstetter Gelner)
>
> Hi! I just recently got a falcon, and am trying to format this old
> Western Digital 300MB SCSI drive I happen to have.
> ...(rest deleted)...

I have been seriously investigating the "parity disable problem" which has during the past year grown from vague rumours, based on an unlikely incidence of "defect" drives, to _finally_ a vendor verified fact!

(Now, just in passing I might add that ICD has updated the utilities to correctly handle TT, Falcon IDE, etc. Latest Link version I saw was ICDBOOT v6.2.0, there might even be later. Free download from their BBS. This might solve your problem, Kendall.)

HOWEVER! Please don't dash out and update just yet (even if it may be a good idea)... After spending some money talking long distance with Western Digital support in California (I live in Malmoe, Sweden; the next phone bill will be, ah, "interesting"...) regarding a really neat WDSP4200 I had which wouldn't work with my system, the support man in California finally checked and came back with the following VERY IMPORTANT assertation:

[* interbang (!?) mode on *]

_NO_ WD SCSI drive in current production allows "parity check disable"!!!

[* interbang off *]

Yes, the official installation guides are very specific and clear in reference to how the jumper settings for "parity check" must be set, with several revison diagrams. "To disable parity checking, install a jumper shunt on W1 jumper pins 1-2." etc etc. Most local service people, sales rep technical support, etc, believe this and think you don't know (bleep) when you keep coming back to them saying this drive, or replacement, just won't work.

In actual fact, WD-support admits "...yeh, well, the design people intended to have this, but, ah, actually, it wasn't implemented..." Folks, there just aren't any disable components installed in the hardware!!! The (*)ing jumpers simply aren't connected anywhere. Parity is _hard-wired_ !!!

Of course, things are never really that simple. I've previously used a WD drive in a TT with no problems. Same WDSP4200 model. What I _think_ happened is that the later volume production series, made in Asia, simply saved on production costs by leaving these components out, since, hey, most PC clones won't know the diff since they all use parity checking.

PROBLEM: This all leaves Atari-hostadapter users up a creek, since we won't _know_ in advance if a given SCSI-drive will work with an Atari system or not before we try it. Indications are that as a result of cost pressures, more and more SCSI drives are being produced with _hard-wired_ parity checking, and the documentation is then just plain wrong. Known examples (in Sweden):
o Western Digital: "all SCSI drives" (probably all made '92 or later)
o Quantum: many? most? all? late production ELS models
o Conner: all? late production high capacity drives

Functional makes (as yet) seem to be Seagate, Maxtor, ...?

Anyone with new SCSI-drives that don't work with Atari-SCSI even after "disabling" parity _must_ assume that it is _possible_, perhaps even _likely_ that the drive will in fact never work, no matter what (local) support says.

Feedback, other vendor contacts, welcome.

The battery pack is (at least on my machine) velco'ed to the circuit board and is connected electrically using a couple of wires and a plug. It can be found by merely removing the hard drive (loosen large screw under front of machine below the hard drive, swing hard drive up and lift out).

Although I am very aware of the structural roles of AES and VDI, my
experiences are

1) graf_mouse for on/off = trouble
2) v_hide/v_show_c is perfectly reliable on AES level

So I always use the v_*_c functions. I've never seen an AES show signs
of confusion running my programs.

If you call really Cconis(), then it cannot be the library (which?), because
it is a direct GEMDOS call.

> I have tried select(0,1L,0L,0L) to wait for input from Gemdos handle 0,
> (stdin?) is that okay? At least the program crashes so I think not...

Try to set a variable to 1L << 0 and give a pointer to it as argument to
select(), because it expects pointers for the sets of file handles.
The function of select is to wait until one or several file handles become
ready for reading or writing. You can also specify a timeout. It is called
with pointers to sets of file handles for reading and writing; theses sets
are overwritten when select returns and contain then bits for each handle
which is ready. The total number of handles ready for IO is returned as result.

Hope this helps

Ulrich

4667. TT networking

Newsgroup: comp.sys.atari.st.tech

From: evanlang@sdf.lonestar.org
Message-ID: <CDI7LB.IA8@sdf.lonestar.org>
Source record: 36685

Alright folks, what is the newest BINARY version of GCC? I just lost my hard disk and I find that 2.4.4 was supposedly buggy. Is it? 2.4.5 is only in source code form last I looked - can't compile a compiler without a compiler, and I'm not sure if 2.4.2 is still there or not. 2.3.3 was what I was using before and it worked well for me.

So, what should I be getting? E-Mail me fast because I have some programming projects I want to test out and that can't be done without a compiler!!

My address is evanlang@sdf.lonestar.org

BTW, why don't we have a separate newsgroup just for new stuff? That way we can here about what shareware authors are releasing and what the new version of GCC and such are without reading 500 messages a day.

We use a TT with an ethernet card by Riebl. There is also a card from
Biodata, a German company. The Riebl card was (is) sold by some German
companies and maybe even Atari still sells it.
For more information I suggest you contact Michael Gehret who is selling
ethernet cards, TCP/IP software and X servers for ST and TT:

It probably would..however are there any more new SST's produced?

>smart to invest in the TT as a new computer. I feel rather ancient with
>my Mega, but I'm not sure how much support there is/will be for the TT.

Certainly a lot...the TT is still a very popular, support as well as product
line is pretty good for the TT (if you don't expect atari to help you out
that it ;))

>From what I understand nothing Atari is making or plans to make in the
>near future is as powerful as the TT. Is this right?
>

Well...I don't really know how to answer that one, as we don't really know,
however...in the CICERO Extrablatt GE-SOFT announced the Eagle, a TT-Clone,
with very fine spec's....if that one ever get's released, then why don't you
try that machine? Anyone in Germany know more about it's development?

That reminds me also of something....if you are looking for a TT, I think
MID-Cities Computer's or maybe ATY can help you.

Hope I could help....but I really think a TT with Graphics Board and Fast RAm
is the way to go :)

One major caveat here: From what I recall, SOME ST's lose MIDI data
and SOME don't. The early ones tend to be the worst. This is a
hideous problem for software authors who want their programs to
actually work on ST's they don't own. (grin)

When I was writing a MIDI-networked game a couple years ago, I found
that the only thing I could do to deal with the problem on my ST was to
add code to resync the network when bytes got lost. I don't think I
ever tried totally disabling interrupts, since I needed joystick input.

In any case, BE VERY WARY of the ST in this regard. I wasted an
enormous amount of time because of this, and never really solved the
problem...

Hi everyone!!! :-)

If any of you is interested in a group buy for FAST modems,
for only 150 dollars, then read on!!!
We need five people in order to get the modem for 150!!!

The modem feautures:
14.4k normal transmision
V.42
V.42bis
MNP-5
and up to 57,600 bauds with V42bis and MNP-5!!!!!!!!!!!!!
(My 2,400 baud modem is going to quit his job very soon!!!)
As you can see this is a fully-loaded EXTERNAL modem that
works with ANY computer with a serial port.

PLEASE respond ONLY if you are interested in buying as soon
as next week, or at MOST in two weeks.
Also JUST email back a phone number where I can reach you,
since I don't have much time to email stuff back and forth,
so we can settle the deal personally and take advantage of
this. Don't forget the time to call!!! :-)

Sincerely,
hacker@acs.bu.edu

The SCSI controler in both Falcon and TT generates parity! Only very simple
ST host-adapters don't generate parity.
I don't know if AHDI uses the parity, though.

All drives I know off _generate_ the parity, you can't disable that - and
it would probaly not make any sense to do so...

4677. followup and new MTOS problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-17 21:06:58 UTC
From: michael@tapestry
Message-ID: <27d8tiINNa1q@ymir.cs.umass.edu>
Source record: 36676
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A few days ago, I posted a message describing a problem I had while trying to install MultiTOS. A couple of people sent mail to me saying that the install program in MultiTOS doesn't work with TOS 1.2 (maybe other lower TOS's as well). Quality software, eh?

Anyway, I think I managed to get the thing installed. First, I created a "multitos" folder on my c drive, then copied the files from the folders on the distribution disk to it (I think I skipped the accessories.). I copied mint.prg to the auto folder and rebooted without any other programs or accessories, and it came up with MultiTOS. Double-clicking on a TOS program didn't work when I did that, so with the semi-working MultiTOS up, I deleted the c:\multitos folder and ran the install program again. Then I rebooted, and MultiTOS seemed ok.

At this point, I'm having new problems. First, the documentation that came with MultiTOS is abysmal. I'd like to find documentation about how to customize the installation and what the possibilities for customization are. Does anything like this exist on the network, or do I have to buy the developer's docs to get the information?

Specifically, I'm looking for: gem.cnf file options, any mint.cnf options that aren't listed in mint.doc, and how to autostart GEM programs under MultiTOS.

I've been trying to get NeoDesk 3.03 to autoboot, but the best I've been able to get is to be able to start it manually after MultiTOS is booted, and then I can't launch any programs from NeoDesk. I've tried all of the following together: neoload.prg in auto folder (I tried putting it before and then after mint.prg.), added c:\neodesk3 to the path variable in gem.cnf, and added exe to the gemext variable in gem.cnf.

I'm really at the end of my rope with this thing, and I'm just about ready to wipe it off my hard disk and ship it back.

I'll appreciate any help.

Thanks,

Michael Kieras

4678. MTOOLS, is there a patch for reading TOS disks?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-18 07:32:49 UTC
From: Steve.Yelvington@launchpad.unc.edu
Message-ID: <27edj1$h7u@samba.oit.unc.edu>
Source record: 36677

Mtools on my Linux system won't read my TOS-formatted disks. I seem to remember discussion of a patch for Mtools -- or am I imagining it? I poked around at atari.archive and didn't see anything like that. Is there a way to read my TOS disks -- most of which are single-sided -- with my Linux system's 1.44MB drive?

(The disks also are unreadable on a PC.)

No, but I had some with my Conner HD in my TT. I had to set it's LUN to 4
or higher, otherwise the system wouldn't regognise it. It's a shot in the
dark, but maybe it helps.

I am having a hard time getting a good copy of dawn125.lzh I believe that is the latest version with the english docs. I think it may be the lzh is not fully implemented on this system or there is simply a lot of corrupted files with the lzh compression method. I have tried wuarchive.wustl.edu and src.doc.ic.ac.uk with no success. Can someone point me to another archive that carries dawn? Maybe in a zoo or arc compression? I haven't had even 1 lost file with zoo or arc. Thanks for your help!

What is the problem with ST disks? Is it because of 5 sects/FAT instead of 3?
If I remember correctly, you can fix this by just changing a #define in the
src of mcopy. Sorry, I don't remember the name.

Hope this helps.
Urs

Hi Martin,

I've just got an 'old' address from Matrix in Germany.
They had a recent change of ZIP codes over there, so it might
take a while until you get some answers:

Matrix Daten Systeme GmbH
Talstrasse 16
7155 Oppenweiler

Hope that helps.

If you are interested in graphics cards, have you heard about the
CyReL SUNRISE M16-1280 True Color High Resolution Graphics Cards
from Cybercube (the company I work for. *grin*) ?

If not, just send me your address and I make sure you will get
the latest brochure and infos.

Regards,

Ralf.

You could try mounting the disks as msdos disks instead. If you're
using a 1.5 HD drive, try mount -tmsdos /dev/fd1H360 /user, if your 3.5 drive
is drive b. You need fdH360 in /dev/ but most distribution packages put
it in there.
If you formatted the disk to 400k you'll need the extended floppy
patches to the kernel.
If you do find mtool patches, please mail them to me, it'd be a lot
easier.

Look on atari.archive in the Ste directory for speed switchers. They might
be in the Megaste subdirectory called "megaste.lzh" or something thusly. I
have FAST.PRG in my autofolder to run first, which sets 16mhz, cache on.
Other programs in the archive set for 8mhz cache, and 8mhz no cache.

I compiled the GNU shell utilities this week because the test.ttp I had
was _really_ weird (so's the version of find I've got... :-(). After
building the shell utils twice, I've got a fairly decent, working
version. I haven't tested them extensively though.

If you want, I can email you test; I don't want to put everything on
atari.archive, since it's untested, and I don't consider myself savvy
enough to test everything thouroughly (not that I have time!). Oh, and
it's also living on a minix partition, and hasn't been tested under TOS.

Don't worry - an application that blocks the screen (by having a menu dropped down, doing a dialog/alert box, updating a window...) only blocks other applications from doing something to the SCREEN.

In other words, as long as your program keeps silent, it won't be stopped. Once your program does a wind_update(BEG_UPDATE), it will be suspended until the app owning the screen does its wind_update(END_UPDATE).

bye, Peter

Just like some other very modern drives, the Maxtor stuff won't work on older
SCSI adaptors.
These include the original ICD adaptor, Mega STE's and Stacy's internal one,
old GE-Soft stuff.

These drives do work fine with newer adaptors.

>before we try it. Indications are that as a result of cost pressures,
>more and
>more SCSI drives are being produced with _hard-wired_ parity checking,
>and the
>documentation is then just plain wrong. Known examples (in Sweden):

So? ICD's AdSCSI series support parity, so does GE-Softs TOPLINK, which is a
cable style adaptor like ICD's except that it is IN the cable and supports
parity. Hard&Soft also has an internal adaptor for MegaSTE and Stacy w/ parity.

And for all the others: I developped a special terminator plug that actually
generates a parity bit on the bus, bringing older host adaptors back into
business.
I can make one for people who need it, but I don't have the time to make more
than five per week...

bye, Peter

4700. VT100 EMULATOR WANTED FOR

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-19 19:43:00 UTC
From: christopher.browne@canrem.com
Message-ID: <60.12794.4019.0N183FF3@canrem.com>
Source record: 36695

Notable programs with Vt100 emulation:

- Uniterm
- CoNNect
- STalker

The first, Uniterm, is essentially freeware. For a LONG time, it was clearly superior to almost anything else. As it is no longer being maintained by the author, other software is catching up.

The second, CoNNect, is shareware (using "beg messages" as the so-called "crippling feature" for those that don't register. There's a test period, and then it starts to gripe at you.)

It provides pretty decent VTxxx support, going up to VT320 emulation. Some Roger character from New Zealand keeps on trashing it because it runs in GEM windows, and thus you can only get 80x24 support by either using
a) Some larger-than-normal monitor, or
b) Some fonts that tend not to be as readable as the system font.

If you're running Gopher, then you probably are doing it under UNIX, and can do an appropriate stty command (i.e., something like 'stty rows 18 columns 78) to have it support the screen size of the CoNNect window that you're using. I've run Emacs in a small CoNNect window, which seems to be a pretty good test of terminal emulation. CoNNect passed the test.

The third, STalker, is a commercial product by one Eric Rosenquist who works for Software Kinetics in Stittsville, Ontario. STalker 3 provides pretty decent VT100 emulation, and runs as a desk accessory. It's sold by Gribnif Software.

The 1040STFM only has a standard 2-layer board, so there are no 'inner'
layers. However, it can still be hard to find ...

4702. E_GEM 1.13 libraries

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 00:20:24 UTC
From: cmedley@wam.umd.edu
Message-ID: <27it08$2tg@cville-srv.wam.umd.edu>
Source record: 36696
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Has anyone ported the E_GEM 1.13 libraries from Turbo/Pure C to GNU C?
There seem to be some problems, even when using the headers from tccompat.zoo
available on a.a.u.e.

The main problem is in porting the assembler code in vars.s and rc_ob.s. GAS
doesn't use Motorola syntax and so far, I'm having some problems getting
GST2GNU to recognize object files created with DevPac ST 2.08...

4703. MiNT cat problem...

The graphics card isn't necessary. 640x480 in 16 colours is pretty good
for DTP. You can always add a graphics card later.

4705. Falcon audio input - help!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 04:26:14 UTC
From: kendall@flammulated.owlnet.rice.edu
Message-ID: <KENDALL.93Sep19222614@flammulated.owlnet.rice.edu>
Source record: 36543

I was wondering if anyone knew what might be the cause of a problem I just came across with my falcon.

I can record audio just fine with a mono microphone (one channel), but when I hook up a stereo line from the headphone jack of my stereo to my falcon, I get a horrible hum. I also don't get much if any of the signal I'm actually trying to record.

The thing that worries me is that a day or so ago this setup was working OK... could something in my Falcon be messed up?

Thanks,
--

Message-ID: <1993Sep20.075945.11347@rzu-news.unizh.ch>
Source record: 36704

Hello all

I've just installed Hackfax 1.00 from the nic.switch.ch which is
a mirror site of wuarchive.wustl.edu and I've a problem.
The SENDFAX.TTP works fine but if I want to start the FAXVIEW.PRG
the program starts and returns imeadeatly (with 4 bombs). I tried
to debug but then the debugger bombs.
The file FAXVIEW.SYS who is listet in the readme.txt isn't there instead
there is the file FAXVIEW.INI.

I've an 1040ST with 1M Ram and TOS 1.4.

How can help ?

Thanks a lot

Beat

4710. Atari Jaguar control pad

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 08:20:40 UTC
From: hacker@bu.edu
Message-ID: <27jp4o$m79@news.bu.edu>
Source record: 36705

Hi everyone!!!

Sorry if this is not the right place to post this,
but I don't frequently live in the atari newsgroups!!!

:-)

All I want to say is that the pictures for upcoming
Jaguar games look *STUNNING*!!!!!!!!!!!!!!!!!!!!!

BUT, what is that stupid controller doing with such
an awesome machine??? I was really disspointed when
I saw such a "thing", and I bet that the designer
of the external case of the Jaguar was NOT the one
who designed the pad. I think that the numeric key
pad looks really stupid there, and will just remind
people of those old atari-coleco controllers.

So PLEASE, can someone fordward this to someone at
Atari and tell them to redesign the whole thing???

sincerely,
hacker@acs.bu.edu

p.s.: Can someone post this in the right group???
Thanks in advance!!!

p.s.#2: Tell atari that I've designed a control
pad here in my college that's driving all
my friends crazy, and that I'm willing to
sell my design to them. Seriously.

Hallo,

Ich verstehe Dein Problem nicht ganz.
Einen Ornder (auch den Auto Ordner) installiert man mittels
des Kommandos 'neuer Ordner' in einem der DESKTOP Menues und zwar auf
dem Bootlaufwerk im Wurzelverzeichnis. Wenn Dein Freund Probleme
mit den Programmen, die im Auto Ordner waren hat, so kann dies
an den speziellen PRG's liegen.

Hope it helps

TOS 1.4 (which works quite nicely with MultiTOS and/or MiNT) has been available for the ST computer line for, oh, at least 4 years now. Your 'quality software' comment is out of order. It is on the same level as a Macintosh owner complaining that a program doesn't run under system 4.1, or that a PC program no longer runs under DOS 2.2.

I know that Atari-bashing has become the 'in thing', but if you insist on using an outdated version of TOS, you'll have to realize that SOME programs aren't going to work correctly. If you own, or wish to own, a hard drive, you had better seriously consider getting a more recent version of TOS than 1.2.

One easy way to get started with TeX is to get Christoph Strunk's CSTeX distribution, say from a.a. It handles all the installation and setup automagically.

What does TOS 1.4 do for you (as far has hard-drives go) that 1.2 does not?
I have a hard-drive and am running TOS 1.2 with no problems. Are there some
bug fixes in TOS 1.4 that would make it worthwhile to upgrade, or are the
enhancements things that most users could live without???

4724. TEX DVI to THINKJET driv

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 18:09:06 UTC
From: randyh@sad.hp.com
Message-ID: <CDnzr7.8ut@srgenprp.sr.hp.com>
Source record: 36716

I just got CSTEX working on my 4meg ST. I have a Star NX1000 and a parallel HP THINKJET printer. The 9 pin DVI driver works fine for the NX1000 but causes too many linefeeds on the THINKJET. I would prefer to use the THINKJET as it is much quieter.

Has anyone out there used a THINKJET with the ST and especially with CSTEX? There is a dipswitch to put the THINKJET into PCL mode instead of EPSON compatible. Is this an option and is there a driver for that?

By the way, I want to thank everyone who replied to my post about non-modal dialogs.

Thanks,
Randy

4725. TT rom dump, please?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 19:13:48 UTC
From: karlo@ifi.uio.no
Message-ID: <1993Sep20.191348.4070@ifi.uio.no>
Source record: 36717

Someone is probably going to flame me for this, but what's life without
a little heat?

I need a rom image dump of a TT - 3.06 german, preferably (I'm into S&M :-).
My roms have gotten somewhat corrupted, so things aren't too hot right now.
I managed to boot a patched TOS 2.06 off disk, so I got things running
pretty smoothly (well, as smootly as 2.06 would run on a TT), but it's
not exactly a desirable setup.

Seeing as Atari's nonexistant in Norway these days, I thought I might as
well give c.s.a.st.tech a shot.

So, if anyone could be helping in any way, drop me a mail? Please?

/Karl Anders Oygard - karlo@ifi.uio.no

4726. Ghostscript 2.61 beta version available.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 19:21:21 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <27kvrh$92n@geraldo.cc.utexas.edu>
Source record: 36719
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

A beta test version of Ghostscript 2.61 is now available for anonymous ftp from

lifshitz.ph.utexas.edu
pub/atari/ghostscript/beta/gs261bt1.zoo.

The Atari interface has changed a good deal, and there are likely to be a few bugs, so please don't upload this file to any other sites. If you can't access lifshitz for some reason and you really need to test something, I can email a copy to you.

Ideally, a tester should already be familiar enough with Atari GS to set it up without much help. The beta archive on lifshitz has MINIMAL documentation and support files.

I am particularly interested in having the following things tested:

1.) The new console window (text i/o) needs a thorough thrashing.

2.) 8 and 16 bit color need to be tested. I would like to hear whether they work and on what hardware.

Atari-specific source code is included, so if you encounter something that doesn't work, you may be able to find the cause.

Comments can be sent to

Tim Gallivan
timg@landau.ph.utexas.edu

4729. Falcon question: 20770 Hz sample rate?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 20:40:29 UTC
From: mpark@carson.u.washington.edu
Message-ID: <27l4ft$mg@news.u.washington.edu>
Source record: 36720

Can someone please explain how the Falcon's 20770 Hz sample rate
is derived from the 25.175 MHz clock? 25175000 / 20770 = 1212.08,
which doesn't make a lot of sense to me.

--mpark@u.washington.edu

4730. SCSI -> ESDI Bridge Controller

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-20 20:54:00 UTC
From: vsnyder@math.jpl.nasa.gov
Message-ID: <27l598$1hp@netline-fddi.jpl.nasa.gov>
Source record: 36722

1. Do you know of SCSI -> ESDI bridge controllers? I have found Emulex MD21 (2 drives) and MD24 (4 drives). Do you know of other controllers, especially controllers that handle 8 drives?

2. Do you know where I can find an MD24 controller, or, better yet, one that handles 8 drives?

E-mail please. If anybody is interested, I'll summarize.

In fact, I'm beginning to think 20770 is incorrect. I generated
a 440 Hz sine tone assuming a sample rate of 20770 Hz; on playing
it, however, it sounds about a semitone flat. This would seem to
imply that the actual sample rate is about 6% lower than 20770...
which would also explain a semitone error in my "pitch"-estimation
program. So if 20770 is wrong (as it appears to be), what is the
actual sample rate (nearest to 20kHz)?

Does anyone have the straight dope on this?

I figured the same as you; these are the rates I calculated (and included in
the falcon.h file I wrote for the GCC library...):

CLK50K 1: 49170 hz
CLK33K 2: 32780 hz
CLK25K 3: 24585 hz
CLK20K 4: 19668 hz
CLK16K 5: 16390 hz
CLK12K 7: 12292 hz
CLK10K 9: 9834 hz
CLK8K 11: 8195 hz

On my Falcon good 'ol FSCK 1.0 by Joerg Lohse did not work any more
FSCK.prompts you for the drive to check, which you enter like this:

[f] [RETURN]

But FSCK always read in the F then apparently garbage ... After
a little bitfiddling, it appeared that FSCK uses Fread on stdio
to fetch one character after the other.

Now the problem is that on TOS4.1

Fread(0, 1L, &foo) a [RETURN] of the keyboard is mapped to a '\0'

whereas on TOS1.4 it is a '\n' as you would have expected.

OK, This may all have been fixed in subsequent releases
of the OS, maybe this is the way it is supposed to be now. (And maybe this
is already known since sooo long)
But people whose software doesn't work, have an idea where the problem
might lie and have a headstart when patching their code...

Nat!

Probably the easiest system to install is CS-TeX (Christoph Strunk TeX).

It comes in a set of about 7 (or is it 8?) archives (roughly filling a 720K disk apiece) and can be found at atari.archive.umich.edu, in a directory path resembling:
/atari/Tex/Cs_tex

It should probably be available at one or the other of the German ftp sites; as I no longer have ftp access, I can't give useful address information there.

CS_TeX includes EVERYTHING, such as:
- TeX binaries (including 2MB & 4MB versions)
- Format files (.fmt)
- BibTex (the bibliography system)
- A reasonable set of LaTeX .sty style files
- Metafont
- "Compiled" fonts for a wide variety of common ST-compatible printers
- Printer drivers for the same (HP Deskjet, HP LaserJet, Canon BubbleJet, Epson Dot Matrix, probably others I don't have and don't care about)
- "Shells" to use to run TeX and Metafont (it's got a desktop, and menu bars with all the relevant options)
- Metafont sources to the Computer Roman fonts

 MMST 2.98 UnRegistered (A)bort (R)etry (T)ake an axe to it

Wow, did you manage to erase a disk by clicking the wrong button or something?
Anyway, check out MSA 2.3+. It is much better than the original MSA program,
which I suspect you are referring to.

MTOS works fine with TOS 1.02, BUT the problem I have found is with the
installer program. My friend has TOS 1.02, and he could not get the installer
to work with the ICD hard disc driver installed. Needless to say, installing
it without an HD wouldn't work well at all.

Luckily, our hardware configs were similar enough for me to copy my
configuration files (installed under 1.04) to his. MTOS works fine on his
machine.

4739. MiNT: Problems reading MIDI port with Bconin(3)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-21 08:31:28 UTC
From: djs@jet.uk
Message-ID: <1993Sep21.083128.5797@jet.uk>
Source record: 36739

(Reposting - I think I didn't send this properly last time...)

I have some code which has been working for years on TOS 1.09 and 1.6, but fails under MiNT 1.04 (standard MultiTOS version) and 1.08 (built by me using Lattice C v5.5).

I have extracted the bit that fails, and put it into a test program, see below. It works OK on device 2, but not device 3 (MIDI). It also works sometimes if run under Xdebug. Failure occurs in two ways: Bconstat(3) returns -1 even though no MIDI device is connected, then Bconin(3) kills MiNT:

```
PID 18 (BTEST) stack underflow
PID 18 (BTEST) BUS ERROR: User PC=0 (base page=blah)
PID 18 (BTEST) rm-q: Unable to remove process from queue
Fatal MiNT error: Adjust debug level and hit a key...
```

The machine is then totally locked up; no keys work and the mouse pointer will not move.

Any ideas? (There is some odd code which I didn't understand in MiNT bios.c, relating to the switching of device numbers 3 and 4.) My code works under TOS, remember.

Thanks in advance for any help...

Test program source:

```
#include <dos.h>
#include <stdio.h>

main()
{
long c;
long status;

status = Bconstat(3);
printf("Bconstat(3) returned 0x%lx\n", status );
if ( status != 0 )
{
c = Bconin(3);
printf("Bconin(3) returned 0x%lx\n", c);
}
return 0;
}
```

Disassembly of btest (with some printfs removed for clarity):

```
; 1: #include <dos.h>
; 2: #include <stdio.h>
; 3:
; 4: main()

>hideous problem for software authors who want their programs to
>actually work on ST's they don't own. (grin)
>
All ST(e)'s I've seen (upto TOS 1.62) lose MIDI bytes due to the IKBD routine locking
the MIDI routine out for too long, causing an overrun on the ACIA.
Some also lose MIDI events to the TimerC routine. Some commercial MIDI s/w fixes
the former problem but not the latter.

>When I was writing a MIDI-networked game a couple years ago, I found
>that the only thing I could do to deal with the problem on my ST was to
>add code to resync the network when bytes got lost. I don't think I
>ever tried totally disabling interrupts, since I needed joystick input.
>
Resyncing is not an option when communicating with a real MIDI device.

>In any case, BE VERY WARY of the ST in this regard. I wasted an
>enormous amount of time because of this, and never really solved the
>problem...

I've also spent an enormous amount of time on this problem; I've disassembled a
fair amount of TOS in the process. The real problem is that MIDI & IKBD share
the same interrupt line so its not possible to code (a fairly simple) MIDI handler
without doing something about (the much more complex) IKBD. The method I used
in EKSEQ1 was to make the offending TOS handlers reenterant using MPF mask registers
to avoid mutual rentrancy. I've been told that it bombs itermittantly
with preblitter TOS versions. The next release will have a full set of bullet proof
custom handlers (damn TOS to hell) and I'll release the source to the handlers.

In the meantime temporarily disabling the IKBD is an easy option that solves 99% of
the problem (and is used on many commercial editors and at least one commercial
sequencer).

My atari portfolio has served me well at high school and university for over a year. But with all the repeated opening and closing, the ribbon cable between screen and motherboard has become damaged.

I am almost certain this is the problem - when the screen is moved, the display flickers, and in most positions will not work at all.

I'm not a complete newbie with electonics - but try as I might, I can't find out how to open the screen case up to remove and replace the cable.

I would really appreciate any advice as to how get the screen open or any other suggestions about the ribbon cable.

Please ..... who is this guy ???

Holding the little, TINY SNES or Genesis controllers is a real nightmare!!!

But have someone tried to hold the Jaguar controller?

I have, it is is really nice. It fits in your hands and not between your
fingers. The keypad is the best with the whole thing. You can change
weapons really fast, and is should be very useful in adventure games.
If conecting to the cablr or phonenet - just dial the number with the
pad ....

In article <1993Sep20.180153.27084@iplmail.orl.mmc.com>, richards@sulu.orl.mmc.com (Larry Richardson) writes:
>What does TOS 1.4 do for you (as far has hard-drives go) that 1.2 does not?

1. Speeds up hard drive I/O
2. Increases standard GEM partition size to 32 meg.
3. No more worry about folder problems, as only open folders 'count' toward the 40-folder limit.
4. General bug fixes
5. Cold-boot from keyboard
6. Speeds up hard drive I/O

Did I mention that it speeds up hard drive I/O? :)

There may be other advantages -- MultiTOS works fine under TOS 1.4, for example.

```
Problem
-------
I hooked up my new SCSI drive and ICD Link last night, and got an error
message similar to this "No ICD HOST ADAPTER, caching disabled". I all of
the cables and connections to no avail.

Solution
--------
I had to place an extra jumper on the drive to enable power to pin 26 of
the SCSI connection.

4752. ST booting, what goes on?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-21 18:10:09 UTC
From: PETERC@v2.ph.man.ac.uk
Message-ID: <1993Sep21.181009.724@nessie.mcc.ac.uk>
Source record: 36595

Dear all,

I came across some source code, awhile ago, to start gulam by placing
the compiled code in the auto folder of your boot disk.
I found it in the Umich archive under the Utils directory and
is called "exe.arc".
It was written for a Mark Someone C compiler and uses a couple
of VDI calls and Pexec.

I want to change it so that I can compile it with HSC, do I
just replace the VDI calls with the corresponding Gemfast routines?

I have a couple of references on VDI calls and they don't recommend
using the open_wk and close_wk calls (which is used in the program)
but point to the virtual workstation routines instead.
Also the author said something about it not behaving very well
when you exit from gulam.

Could someone explain the booting procedure in some detail and
could they also say why it is an advantage to run gulam (or any other
TOS program) this way (apart from the convenience, does it let you have
more RAM)?

I'll be most grateful for any illuminating comments.

Thanks in advance,

Peter - peterc@v2.ph.man.ac.uk

4753. ST booting, what goes on? (corrections)

Hello,

I really like my mono monitor and I have to say that it is one of Ataris better products.

Now I have a problem;

For a few weeks whenever I switched it on it *crackled* loudly for a few seconds. Then one day it gave an almighty crackle and never came on.

I should point out that the crackling/vibrating came from the black plastic switch.

I have taken it apart and found that the two metals contacts were badly carbonised and one was corroded quite badly.

QUESTION:

Where can I get a replacement switch for my SM125 monitor? I have tried a number of places with no luck.

Thanks very much,
Jake

You need Atari's Hard disk utilities. The newer versions don't know about Megafiles so I would look for AHDI v3.02 as this is what I use for my MegaFile 60. This should be available at atari.archive.umich.edu.

4758. New program on comp.binaries.atari.st!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-22 05:04:07 UTC
From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Sep21.230407.1631@rivers.acc.uwrf.edu>
Source record: 36604

Located on comp.binaries.atari.st is a utility that I designed which runs other GEM or TOS programs. You may do this at startup, or run the program anytime. I have a stock 1040STe, and it works perfectly. Check it out! It's free! All you need is 200KB (approx.) and programs whose memory requirements don't exceed 100,000 Bytes. I use this to run STBlank's accessory as a program, set-up the screensaver, and NOT have any accessory taking up ram space. (plus a couple other programs run at boot too.)
If you like it, write to me below, or if you don't like it write to me below.
You can't lose!

Hello,

I haven't read this newsgroup before, but I hope that someone will be able to help me out. I'm about to enter the world of MIDI, and having an Atari ST at home I was thinking of trying some of the PD MIDI programs available at the many ftp sites.

Now, my question is: I don't have a modem, so would it be possible for me to download the files to a PC/Sun WS, and copy them to a floppy that the ST would be able to read? I seem to remember that the disk-format is different between DOS and the ST, but is there a way to get around it (hardware or software), other than getting a new disk drive for the ST?

Cheers,
Pelle ,,, ?

In general, operations on hard disks are sped up by several factors
when using TOS 1.04 (compared with 1.02 and 1.00). Apart from that,
TOS 1.04 fixes some serious GEMDOS problems that could in the end
wreck your files, and it alleviates the FOLDRxxx problem a lot.

If you're thinking about an upgrade, however, you should probably
consider investing in TOS 2.06 and an expansion card for it.
This will give you the new Desktop, speed and functionality
improvements, and a larger address space for the TOS ROMs, i.e.
the possibility to upgrade to upcoming bigger TOS versions.

Well, the hands-on informed service word is that:

Falcon030 SCSI seems to be able to handle both flavors, ie parity-check-enabled
and -disabled configured drives.

TT030 _requires_ parity check disable, just like the other host-adapter SCSI
solutions for the ST/STE models.

I've checked with folks that ought to know, who handle this daily, and it fits
my own experience (except for F030, which I've not handled).

IconManager was an early attempt to define *something* for MTOS. This is entirely outdated by the things Atari did in their latest MTOS beta releases.

Please forget it.

No, I use AHDI 5.00 every day with my Megafile 60 and it works
perfectly. By the way the utils are called HDX. Which is up to version
5.04 I think. Newer versions of the Atari harddisk software are
backwardly compatible. This means that even the new AHDI 6.0x will work
with your megafile, but you don't need that version since you do not
have an IDE drive I suppose.

Well, your references are right, in the normal situation. However, there is no physical workstation (eg a screen) open when the AUTO folder is being executed. The AES opens the first physical ws when it runs, which is after the AUTO folder has finished (or rather, exec_os is jumped to).

Thus to use the VDI in the AUTO folder, you *must* do a v_opnwk() and a v_clswk() in your program.

4766. Overscan on STe, software only solution?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-22 13:34:41 UTC
From: gvc87r@ecs.soton.ac.uk
Message-ID: <27pk9h$luc@louis.ecs.soton.ac.uk>
Source record: 36614

Hello, thanks to all the people who replied to my original Overscan query. Now for the next question ...

Has anybody out there implemented a software only overscan using the vbl interrupt and hertz change trick but, with support for initializing the GEM desktop to the increased resolution?

Obviously only vertical resolution is expected to increase rather than load the CPU for the side borders, though a vertical resolution of 275 pixels seems possible in low/med res. Its probable that nothing can be done to extend the high res though (fixed frequency).

I've tried HDX from the Atari's Hard disk utilities to zero the spectre partition but HDX don't recognise the spectre partition. The only way with HDX is to repartition the disk. Doing this will erase all the data on it.(-> backup & reinstallation of the software & restore of the datas ... : too long).

Dave Small says in the spectre docs that changing the partition type from ACK to GEM can help.

So I need to read, modify and write the sector 0 of the disk.

4771. Everything you wanted to know about GDOS!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-22 22:27:46 UTC
From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Sep22.162746.1634@rivers.acc.uwrf.edu>
Source record: 36618

EVERYTHING YOU EVER WANTED TO KNOW ABOUT GDOS (AND MORE)

by Douglas N. Wheeler

WHAT IS GDOS?

GDOS is an extension to GEM which adds new capabilities to
your ST. GDOS is available with many commercial Atari programs,
as well as to registered Atari developers ($500 if it is to be
distributed with a product, free if it is not going to be
distributed).
The three primary new capabilities are:

1. The ability to use multiple fonts in various point sizes
on the screen, printer, and other output devices.

2. Allows the creation of metafiles, which are standardized
files intended to be usable by many different applications. This
allows files created in one program to be used in another.

3. Support for various output devices with resolutions up
to 32,767 x 32,767 (including emulation of this resolution on the
screen). This allows graphics to be printed at the highest
resolution of the output device.

HOW TO USE GDOS

In theory, using GDOS is as simple as putting GDOS.PRG in
your AUTO folder and booting the computer. In practice, though,
a series of conditions must be met. The most important of these
conditions is that there must be a valid ASSIGN.SYS file present
in the root directory of the boot disk.
The following is a typical ASSIGN.SYS file.

```
PATH=C:\GDOS.SYS
;
01p SCREEN.SYS ; default screen
;
02p SCREEN.SYS ; low resolution
ATSS10.FNT ; fonts
ATSS12.FNT
ATSS18.FNT
ATSS24.FNT
ATTP10.FNT
ATTR10.FNT
ATTR12.FNT
ATTR18.FNT
```

```
ATTR24.FNT
;
03p SCREEN.SYS ; medium resolution
ATSS10CG.FNT
ATSS12CG.FNT

ATSS18CG.FNT
ATSS24CG.FNT

```

As you can see, I have divided the file into distinct groups. The first line of the ASSIGN.SYS file is used to tell GDOS where the fonts and device drivers are located. This line must always start with PATH= which is followed by a pathname of

up to 64 characters locating the fonts and drivers.
Following the path identifying line is the list of device drivers and their associated fonts. Each group is composed of four parts. First if a number representing the type of device:

01-10 Screen drivers
11-20 Plotter drivers
21-30 Printer drivers
31-40 Metafile drivers

41-50 Camera drivers
51-60 Tablet drivers

The Atari STs have four built-in device drivers, they are:

01 Default screen (used when an application doesn't care about the screen resolution)
02 Low resolution screen
03 Medium resolution screen
04 High resolution screen

Immediately following the device number may be a "load flag" of either "p" or "r". A "p" indicates that the device driver is "p"ermanent and does not need to be loaded by GDOS. Because the ST has it's screen drivers built into ROM, there will be a "p" after devices 01-04. An "r" indicates that the device driver should be kept "r"esident, causing GDOS to load the device driver immediately and hold it in memory. If a load flag is not present, GDOS will only load the device driver when an application opens (accesses) that device.
After the device number and load flag is the filename of the device driver as it appears in the disk directory. In the case of ROM-resident drivers, the filename is only a place-holder (but must be present). Keep in mind that the device driver must be in the folder specified in the path line.
On the lines following those three items is a list of fonts associated with that device (again, these are the filenames as they appear in the indicated path of the disk).
You may have noticed a few lines with semicolons (;) in them. GDOS will treat any text on a line to the right of a semicolon as a comment and will ignore it.
Some ASSIGN.SYS files have a device 00 (00p SCREEN.SYS). This can help prevent incompatibilities between GDOS and some older (pre-GDOS) programs. On the other hand, including it can cause other problems. It is suggested you leave it out unless absolutely necessary.

EDITING/CREATING ASSIGN.SYS

Now, why would you want to change your ASSIGN.SYS file?
Well, if you have just one program which uses GDOS, and you are happy with the fonts you have, then there is no reason to change

it. But, now that GDOS is beginning to be used more on the ST, many of us are acquiring a collection of GDOS applications and fonts. By editing or creating a new ASSIGN.SYS, you could create a "universal" ASSIGN.SYS and font/driver folder to be used with all of these programs!
Luckily, the ASSIGN.SYS file is a standard text (ASCII) file which may be edited with most text editors and word processors. The only requirement is that the file does not contain any formatting codes. This can usually be accomplished in a word processor by turning document mode off, or selecting "Save as text" (check your word processor manual for exact instructions

for doing this). If you are using a text editor, such as MicroEmacs or Tempus, there shouldn't be any special saving techniques.
Starting at the top, the first thing you may want to change is the PATH= line at the beginning of the ASSIGN.SYS file. By changing this line, you can put your fonts and printer drivers on another disk or hard drive partition (instead of your boot disk). If you are using floppies, keep in mind that this directory (folder) must be present when an application accesses any of the GDOS devices. Also, to speed booting, this directory should be present when GDOS is loaded.
Below is a list of my recommended configurations based on what arrangement of disk drives is being used.

One floppy drive:
Boot disk (drive A) with:
AUTO folder containing GDOS.PRG
GDOS.SYS folder containing the fonts and drivers
ASSIGN.SYS with PATH=A:\GDOS.SYS
Any GDOS application(s) (you may wish to create separate boot disks for each GDOS application)

Two floppy drives:
Boot disk (drive A) with:
AUTO folder containing GDOS.PRG
ASSIGN.SYS with PATH=B:\GDOS.SYS
Font/driver disk (drive B) with:
GDOS.SYS folder containing fonts and drivers
Application disk (drive A after booting GDOS) with:
Any GDOS application(s) (you may wish to create separate application disks for each GDOS application)

Hard drive (booting from floppy):
Boot disk (drive A) with:
AUTO folder containing hard drive boot program and GDOS.PRG
ASSIGN.SYS with PATH=C:\GDOS.SYS

Hard drive partition C with:
GDOS.SYS folder containing fonts and drivers
Any hard drive partition with:
Any GDOS application(s) (may be on any partition)

Hard drive (autobooting):
Hard drive partition C with:
AUTO folder containing GDOS.PRG
GDOS.SYS folder containing fonts and drivers
ASSIGN.SYS with PATH=C:\GDOS.SYS
Any hard drive partition with:
Any GDOS application(s) (may be on any partition)

Of course, these are only suggestions, and other configurations may be better for different applications.

Hopefully you should now be able to create other set-ups without too much difficulty. There are a few "musts" that have to be observed:
1. GDOS.PRG must be in the AUTO folder of the boot disk.
2. ASSIGN.SYS must be in the root directory of the boot disk.
3. The PATH= line in the ASSIGN.SYS file must contain the complete pathname of the folder containing the fonts and drivers (GDOS.SYS is Atari's current name for this folder--previously, Atari called it GEMSYS. You may, of course, choose any name you like).
4. The fonts and drivers must be in the right place when an application tries to open a device.

Adding a new device driver or new fonts is very simple. All you have to do is put the device driver and/or fonts in the correct folder (as defined by PATH=) then add the filenames to the ASSIGN.SYS file.

A BIT ABOUT FONTS

One question about GDOS fonts that people ask is, "when are the fonts loaded?" Many people are under the impression that all the fonts are loaded when GDOS is initially loaded. This is not true (and cannot be done). An "r" load flag in the ASSIGN.SYS file will cause GDOS to load only the device driver, not the fonts. Fonts are loaded only after an application opens a device and asks for the fonts to be loaded. At that time, GDOS will attempt to load all the fonts for that device. If there is an error (can't find the find, not enough memory, etc.) GDOS will skip over that font and continue with the next one. When an application is through with the fonts, it can "unload" the fonts to free up that memory.
Another fact that many people don't understand is that the font filename is irrelevant to GDOS. Each font has a "header" consisting of various parameters, some of these are: point size,

font name, and a font ID which is used to identify fonts of the same type (i.e. all swiss fonts have the same ID). Another thing to note is that GDOS does not handle line spacing, this is handled by the application regardless of the actual size of a given font. Some programs use the point size to determine line spacing, and others use the actual height of the font (yes, the point size can be set different from the actual size).
For those of you creating your own fonts (with GEMFED, FONTZ!, or any other way), you must assign a unique font ID (from 0 to 32,767) to each of your fonts, and all font of the same type (i.e. Times), but of different size, must have the same ID. You should also note that some GDOS applications can only use fonts with an ID between 0 and 255. Because of this, it is advisable to keep your font IDs in that range.
Another thing you must know when creating your own fonts, is the resolution of the devices you are creating the fonts for. The following is a list of most of the currently available

devices and their resolution.

Low resolution screen 45 x 45 (horizontal dpi x vertical dpi)
Medium resolution screen 91 x 45
High resolution screen 91 x 91
9-pin dot-matrix printer 120 x 144
24-pin printer 180 x 180 or 360 x 360 (NEC P-series only)
Laser printer 150 x 150 (some) or 300 x 300

(dpi figures for the screen are approximate)

As you can see, most of these devices have square (round) pixels. This allows for sideways printing using the same fonts as for vertical (normal) printing. A notable exception to this is with the 9-pin dot-matrix printers, which will distort characters when printing them sideways. Different drivers handle this differently, they either ignore the fact (and print distorted characters sideways), or they print the left and right sides of a horizontal page on two separate vertical pages, which must then be taped together. The first method is the easier (and faster) of the two, but the second method will produce correct characters, and the taping isn't too bad if you are going to photocopy the final product.
It would be possible to create separate fonts for sideways printing. but so far this has not been done. Also, some Epson printers have a 144 x 144 dpi mode (double plotter mode) which could be utilized. This would not only allow non-distorted sideways printing, but offers slight higher resolution in the horizontal axis.

FONT FILENAMES

As I stated earlier, font filenames are not used by GDOS.
To us humans, though, consistent filenames can greatly simplify things. With the official release of GDOS (late 1987), Atari adopted a standardized way of naming font files. Here I will explain Atari's idea and add a few extensions.
A font filename like ATSS10EP.FNT may look meaningless to someone who doesn't know how the filename was derived, but is, in fact, very functional.
The first and second characters (AT) indicates the creator/distributor of the font (in this case Atari). Atari has suggested that these characters be "AT" for all fonts used on the Atari; this seems meaningless to me, as I don't have any fonts for any other computers on my ST disks (why would I?). I feel these two characters can be put to better use to specify the creator or distributor of the font.
The third and fourth characters (SS) identify the typestyle (in this case sans serif). These should be unique to a particular rendition of a typeface.
The fifth and sixth characters (10) specify the point size of the font. This should be the point size as printed on the

device the font was designed for, not the pixel height. Also, sizes less than 10 should have a leading zero (i.e. 06) to maintain the overall structure.
The seventh and eighth characters (EP) specify the device for which the font was designed (in this case the Epson 9-pin driver). If there are no seventh and eighth characters, the font is assumed to be for the high-resolution screen.
The filename extender on all fonts will be .FNT.
Although not many companies/individuals have produced GDOS fonts for the ST (yet), I recommend that all font filenames follow this convention to avoid confusion. I also suggest a few standard identifiers:

Creator/distributor:
AT - Atari
MG - Migraph*
TW - Timeworks*
NC - Neocept*

Typestyles:
SS - Sans Serif (Atari's Swiss)
TR - Times Roman (Atari's Dutch)
TP - Typewriter (Atari)
DB - Dingbats (Timeworks' Bullets)*
DL - Drury Lane (Timeworks)*
MA - Madison (Timeworks)*
RK - Rockface (Timeworks)*
RA - Ravinia (Timeworks)*
CL - Camelot (Neocept)*

Device:
(none) - Monochrome graphics (high/low resolution screen)
CG - Color graphics (medium resolution screen)
EP - Epson 9-pin dot-matrix printer (120 x 144)
SP - Star NB-15 24-pin dot-matrix printer (180 x 180)
LB - Atari SMM804 9-pin dot-matrix printer (120 x 144)
LS - Standard laser printer (300 x 300)
MF - Metafile
MG - Monochrome graphics (high/low resolution)*
NC - NEC P-series 24-pin dot-matrix printer (360 x 360)*
LL - Low resolution laser printer (150 x 150)*
LQ - Epson LQ-series 24-pin printers (180 x 180)*

* indicates unofficial representations which I suggest in an effort to standardize font filenames, and to simplify the whole matter.

In many cases, the creator/distributor is not important, in which case the first four characters can be used for the typestyle. You will also notice that I have listed typestyles from various companies, I have done this because I recommend that you rename all of the font you currently have to match the above conventions, this will save you a lot of confusion in the future when you may have ten times as many fonts. One thing to note if

you create a master ASSIGN.SYS file, is that although the Timeworks Swiss and Dutch fonts are different from Atari's, they use the same font IDs. GDOS could get very confused if you have two fonts with the same ID and point size. My personal recommendation is to replace Timeworks' Swiss and Dutch fonts in the 10, 12, 18, and 24 point sizes with the ones from Atari, as I feel these are much more professional and true to the original Helvetica and Times Roman typefaces.
Because the font filename convention has changed since GDOS was first made available, it is helpful to know the old format (which is still being used in many cases). The old font filenames were laid out as follows:

cccrttpp.FNT

ccc - Creator/distributor (for screen fonts, i.e. MIG = Migraph) or Device (for other fonts, i.e. EPS = Epson 9-pin printer)
r - Resolution (i.e. L = low res, H=high res)
tt - Typeface (i.e. SS = sans serif, as above)
pp - Point size (as above)

METAFILES

Metafiles are theoretically ideal graphics files (keeping in mind that text is represented graphically) which can be exchanged between different GDOS applications. Metafiles are those files with a .GEM extender. Metafiles are "ideal" in the respect that

they are resolution independent. They are simply instructions for the computer to recreate a page on any output device at that device's highest resolution. This is accomplished by storing commands for drawing lines, circles, rectangles, text, etc., unlike most picture files (.NEO, PI?, etc.) which store the dots making up an image.
Unfortunately, the metafile standard is not being used consistently yet. This results in programs not being able to read metafiles created by another application. In most cases, the fault lies with the program trying to load the metafile, not the creator. Many different parameters may be present in the header of a metafile, but only a few of these are required. Many applications expect (and need) some of the optional parameters to be present to properly represent the image. As such, they have difficulty loading files which don't have these parameters. Currently Easy-Draw (version 2.3) is the most capable of the available GDOS applications, and can read just about any metafile.
Some of the more recent GDOS applications are allowing the use of GEM image files (those ending in .IMG). These are bit-mapped images similar to those created by the various ST paint programs (but without the screen size and resolution limitations). As is the case with other paint files, these images may be jagged or blocky when printed on a high resolution device.

A very important fact about images in metafiles is that the metafile does not actually contain a copy of the image. The metafile only contains the filename of the image on disk. This means that you must not remove the disk containing an image while the metafile is being printed, and every time you print that metafile, the image must be in the same disk (or you will have to change your file). If GDOS can't find the image, it will just skip over it. Be warned.
For all you programmers, currently some programs (such as OUTPUT.PRG and OUTPRINT.PRG) have difficulty handling metafiles with large coordinates. Try to keep the coordinate space as small as possible while still maintaining enough for good output quality.

MISCELLANEOUS COMMENTS

If you are using the Timeworks Desktop Publisher ST (TDTP), you must run the FONTWID.APP program each time you modify the ASSIGN.SYS file. Another important fact is that the relative widths of the Timeworks fonts are not the same for different devices. What this means is that if you create a document with TDTP installed for use with an Epson 9-pin printer, then load the file into TDTP installed for use with a laser printer, the text will be re-flowed. This may result in different page breaks, lost text, extra white space, etc. The best solution to this

problem is to create the document with a TDTP installed for the device which will create the final copy. Another idea is to use Atari's fonts (if you have them--they are not public domain), as the relative sizes between devices is very close (there still may be a few differences, but can be fixed readily).
It should also be noted that Timeworks' ASSIGN.SYS files is a mess. Apparently they list all the fonts they have available for all their device drivers in one ASSIGN.SYS file. I suggest you create your own based on the information presented here.

For those of you who have seen a lot of DEGAS Elite GDOS fonts floating around, don't get too excited. For those to print properly (even blocky), you must have matching printer fonts for the screen fonts. GEMFED or FONTZ! greatly simplify this process, but if you intend to create a complete set of fonts in four or five sizes, you will have a lot of work ahead of you.

Anyone creating fonts for the general public (either commercial or public domain), try to remember that not everyone is using the same kind of monitor or printer you are. If at all possible, create fonts for all the devices I have listed above.

For those of you creating fonts with FONTZ!, you should be aware that scaling fonts may change the aspect ratio of the characters. I'll say it again: Creating high quality fonts is a lot of work. Period.

One thing I didn't mention are metafile fonts. These are

not really fonts, but merely width tables designed to keep correct character spacing in a file when used with different GDOS applications. They are rarely used and, in most cases, can be eliminated without any loss of quality.

Because GDOS has gone through many revisions, there is some confusion over which is the latest. When GDOS is loaded, a message is displayed on the screen saying it is installed, and the version number. The original GDOS displayed "GEMVDI Installed". After that, it switched to "GDOS Version 1.x Installed". The most common were 1.1, 1.2, 1.3, 1.5, and 1.8. The newest revisions of GDOS display "GDOS RELEASE 1.x Installed", with 1.1 being the newest (1.0 is still widely used). As you can see, it is very important to read the boot-up message when determining which revision you are using. Also, as a sidenote, if you can't get RELEASE 1.0 or 1.1, you should try to avoid Version 1.8, which had some problems.

To prevent problems with some of the device drivers available, fonts should be listed in the ASSIGN.SYS file in ascending order by font ID. Some device drivers will not find fonts which are listed out of ID order.

Some of the GDOS fonts available have the entire ST character set defined, including greek, hebrew, and other character (most are unused by the average person). As you might imagine, these take up space, usually, more than 50% of the font file! So, if you're running out of memory (especially with a Mega ST2 and SLM804), you can use FONTZ! to strip out the upper characters. Do this by setting the upper ASCII value to 127.

Many people who have seen printouts of GDOS text have complained that the text is blocky. This blockiness is usually the result of font scaling. If a device driver does not have a font available in the requested size, it will use the next smaller size, or it may double the size of a smaller font. It it uses the next smaller size, the text will look strange, because it will have the spacing of the requested size, with the character size of the actually used size. When doubling a smaller font, blockiness will occur, and even then, the requested size may not be obtained. The best solution to this problem is to be aware of what size fonts are available, and only use those in your files.

Currently there are rumors of a future version of GDOS which supports scalable outline (or vector) fonts. It's important to realize that GDOS does not create the characters. The device drivers are responsible for creating the actual characters, and could be rewritten to support outline fonts without any (or very minor) changes to GDOS.

Ever since GDOS was released for the ST, people have been complaining, saying that GDOS was supposed to be included with the ST. While Atari may have planned that originally, I don't

believe Atari ever stated publicly that GDOS was to be included. Keep in mind that much of the early ST documentation was based on the IBM version of GEM, and reflects DRI's handling of GDOS, not Atari's.
Also, at this time, Atari has no plans to incorporate GDOS into the TOS ROMs.

GLOSSARY

Aspect Ratio - The relation of width to height. Maintaining a constant aspect ratio ensures the same proportions regardless of size.

Device (Graphics Device) - Anything used to create some form of output, usually on a video screen or printed on paper or film.

Device Driver - A computer program used to control a device as specified by a "master" application.

Font - A typeface of a given style and point size.

GDOS - Graphics Device Operating System; an extension to the Atari ST's operating system allowing for the use of various fonts and graphics devices.

GEM - Graphics Environment Manager; the portion of the ST's operating system which is responsible for most of the visual aspects of the ST.

Header - A portion of a file (usually at the beginning) containing various parameters describing the file.

Line Spacing - The distance between successive line of text, usually measured in points.

Parameter - A number or other symbol used to represent a given attribute (dimension, color, direction, size, mode, etc.)

Pixel - Picture element; a single dot, usually one of many used to create a complete image on a video screen or printed on paper or film.

Point - A typographical unit of measure; approximately 1/72".

All you have to do is format a disk in 720K under DOS, and it'll work
perfectly in the ST. In fact, it'll work in a recent Mac as well. I use
a 720K DOS format for shoveling files between my ST, and the university's
Centris 610s and PC clones. Really handy. Also, if you have TOS 1.4 or
higher, ST disks are formatted as DOS automatically.

Atari's CDROM XFS still is in Beta test, but there's still Metados 2.0.
Both currently don't support Rockridge.

4775. Memory protection problems with Before Dawn 1.25 under MultiTOS

Newsgroup: comp.sys.atari.st.tech

I keep getting memory protection violations when using BeforeDawn 1.25. They are of type 'free' according to ALERT.ACC. Mint then kills the DAWN process (i.e. DAWN.ACC). I suppose BeforeDawn tries to access memory it does not own and which has not been allocated to any other process.
Has anybody got it to work with memory protection enabled ?
My configuration: TT with 4+4 Mbyte, UK TOS 3.06, MultiTOS 1.0 (Mint 1.4 + AES 4.0).

The ICD utilities come with (Atari's?) metados driver, which allows both
High Sierra and ISO9660 format disks to be mounted as logical drives Y and Z.
The standard utilities require an ICD host adaptor, but I think that there
is a PRO version that can run with other people's adaptors (and therefore,
I presume, with the TT SCSI port).

I'm trying to use an old SCSI hard drive that I originally formatted with 7 (seven) partitions with my ST using and ICD driver. Now I have a Falcon030 I'm trying to read that HD through the SCSI port. I can read the first 4 partitions but I can't seem to access that next 3.

Any ideas?

My current configuration is: Drives A+B, floppy. Drives C+D+E+F, internal IDE. Drives G+H+I+J, external SCSI.
Installing devices just gives G+H+I+J.

I no longer have my ST or else I would just copy everything on those last 3 partitions onto the first 4. Do a bit of backuping and then reformat the whole thing.

-Andrew

I know that you were looking for a PD program, but I just *have* to mention that
other harddisk utilities *can* do that without having the user mess around with
sector 0.

Peter Missel hacked the following on 21 Sep 93 (to All)...

> So? ICD's AdSCSI series support parity, so does GE-Softs TOPLINK...

ICD technical support and the AdSCSI ST series manual both emphatically say
parity check must be disabled for the SCSI drive to function with Atari. Also
from the Link documentation v6.2.0:

[-v-<snip>-v-]
This version also disables Parity checking on Quantum ELS
series 3 1/2" hard drives. Of course, to do this, the drive
must be connected to an AdSCSI or Advantage series host adapter.
[-^-<snap>-^-]
Why bother if this isn't necessary as you say?

> And for all the others: I developped a special terminator plug that
> actually generates a parity bit on the bus, bringing older host adaptors

Look at the German PD utility called GEMView. It displays GIF pix (among many formats). Then, any snapshot accessory would do the trick (most snapshot accessories produce .PI1 to .PI3 files.)

Hi, out there!

I'm thinking of attaching a CD rom drive at the SCSI port of a TT030.

Does anybody know of driver software for standard ISO-9660 format,
with Rockridge extensions (or without)?

Either MinT or TOS.

Uwe

I don't have it for you, but if you do find it let us all know. In the mean time you may want to take look at 'fsk'. Here is som info I took from alt.sources.

A new version of our SVR4 Filesystem Survival Kit has been posted
to 'alt.sources' on September 18, 1993

Latest version: fsk-0.92

1. What is the 'Filesystem Survival Kit'

The Filesystem Survival Kit is meant to provide the filesystem drivers that AT&T forgot to include with their SVR4 UNIX system, but are more and more necessary in a modern installation. Although platform independent in principle the drivers in this package are primarily meant for the SVR4 versions available on the Intel platform.

If you don't have SVR4 (or possibly Solaris 2.x) this package is probably not for you. You could use it as a basis for your own developments though.

The 'Filesystem Survival Kit' provides the following
filesystem drivers:

- An ISO9660 filesystem driver that enables you to mount CD-ROM disks under the UNIX System V Release 4 operating system for the Intel platforms.

The ISO9660 filesystem supports:

- plain iso9660 CDROM format

- iso9660 CDROM format with RockRidge extensions

- High Sierra CDROM format

I know it isn't the answer you want but I hope it helps.

If I remember right, each type of disk is defined in a header file (can't rememeber which one though.) In this file the number of tracks/sectors/sides and the device (which can be any 3.5" drive) are listed. Just add one that specifies the geometry of the 360K/400K disk you are using and recompile.

Hope this helps,
Kurt Olsen

4784. Questions about MTOS programming conventions.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-23 17:07:36 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <27sl4o$8ph@geraldo.cc.utexas.edu>

Hi,

A beta tester for Ghostscript 2.61 has reported some problems when running under MTOS. Can someone enlighten me about the following issues?

1.) It is apparently conventional for an MTOS application to restore the original color palette whenever another application (or an accessory) is topped. I sort of thought that MTOS would take care of this but I guess not. I suppose I can restore the palette if I receive an AC_OPEN message (what happens if two accessories are opened -- will my program try to resotre the palette again?), but how do I know whether another application has been topped (when my application is running in the background)?

2.) When GS is ready to display an image, it tops the window that the image will be displayed in and then uses the resulting (automatic) redraw message to update the window. This doesn't appear to work properly under MTOS, although it seems to work fine under plain TOS. What apparently happens is that only the window border is drawn by the AES, but no redraw message is sent. Topping the window with the mouse causes only the portions of the window that would have been covered if it had not been topped to be redrawn. This same behavior apparently occurs under TOS when WINX is being used.

Does anyone know what is happening here? Is it bad form for a program to top its own windows under MTOS (is MTOS trying to stop it from happening)?

Thanks for any help.

-Tim

Your program will get a WM_UNTOPPED (AES msg number 30) message when one of its windows is "untopped" because some other application or accessory has been topped; this happens only if your program's window was the top window and no longer is.

You'll get either a WM_TOPPED message (if the user deliberately tops your window) or a WM_ONTOP (#31) message (if your window becomes the top one because another window was closed) when your window is (or is supposed to be) topped. The window is already on top by the time you get WM_ONTOP (i.e. do NOT try to force it on top with wind_set).

>properly under MTOS, although it seems to work fine under plain TOS.

Why bother doing this? Just call your redraw function directly. This does require that the redraw function walk the window's rectangle list, but that's pretty much necessary anyway even under regular TOS (since redraws can happen while your window is behind an accessory's window). The big advantage of this method is that it gives the user control: if the user was doing something in the foreground (e.g. in a text editor) they may not appreciate having ghostscript's window suddenly pop up on top.

My favourite is FASTGIF (available via anonymous FTP from atari.archive.umich.edu). It converts to PI1, and is (actually) very fast at doing it. Then there is of course Photochrome, look for PCHROME3 (also at atari.archive). Photochrome can convert to Spectrum-512 pictures, and it also has its own picture format which looks extremely nice (especially on a STe). There are plenty of others to, but those are the two I use. Look for them, and many more, at atari.archive.

/Viktor.

Source record: 36640

A couple years ago, my Atari 1040ST's internal floppy drive started haveing a few problems. It would seem to "miss" information, and would appear to eat disks at random. My copy of Flash was mysteriously reduced to 0 bytes, by copy of R-TYPE no longer loaded properly, and some disks gave the dreaded "garbage directories" on the desktop. I've since moved on to different computers, but want to get the ol' ST back on line (I'll admit it--I miss it).

Does this sound like a problem I could diagnose/repair myself? Could it be related to wear? drive RPM? age? my previous residence for a year of college next to a 50 kilowatt FM radio station? Please help!

Also, offers for other drives will be gladly considered.

Thanks in advance,
-- Patrick

This is because the ICD software doesn't partition fully AHDI-compatible,
i.e. it doesn't work like the AHDI 3.00 release notes recommend it. This
results in some AHDI compatibel drivers (and AHDI itself, of course) not
being able to recognize more than 4 partitions.
You have to repartition you drive with AHDI compatible software (e.g. HDX)
to get it right. Blame ICD for not being compliant to release notes that are
more than 4 years old now.

4793. ICD v AHDI speeds

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-24 08:58:19 UTC
From: Iain.Laskey@barclays.co.uk
Message-ID: <CDuox7.LF2@barclays.co.uk>
Source record: 36549

I have had to use AHDI instead of the ICD drivers when I changed from having a MSTe to a Falcon. Apart from the fact that AHDI is pretty dire from the utility point of view, is it worse speed wise?

I have 2 external HDs which used to rate at 1150K/s at 17ms and 550K/s at 34ms under ICD. I just got the Falcon happy version of RateHD and it reported 800K/s at about 16ms for the IDE (Can't rememeber exactly), and 750K/s at 34ms and 450K/s at 65ms for the other drives.

What's going on? I would have thought that having no ICD board would help things if anything. Could it be the fact that they are SCSI drives instead of SCSI2 and there is some kind of translation overhead?

A number of disk utilities allow access of this sector, including of course
Ataris own CHKDISK. Presumably you _do_ know what to change and where this is
located, especially since there should only be one instance of "ACK" written in
that sector.

No, they are not 100% equal (a MEGA ST keyboard wouldn't fit physically into a 520 and the same is true the other way round, I've tried :-)

But the design and components are the same, so you could "steal" some parts from one of them to repair the other one (almost everything IS possible, I ones repaired a keyboard for a friend where the print was broken in two - glue, patches, cables and soldering does the trick :-)

In <2c98f0e0@daggskim.ct.se>,
Bo Leuf (bo.leuf@daggskim.ct.se) wrote:

BL>_NO_ WD SCSI drive in current production allows "parity check disable"!!!

That may be true, but I think that's not solely WD's fault. The SCSI specs say:

Data parity DB(P) is odd. The use of parity is a system option (i.e., a system is configured so that all SCSI devices on a bus generate parity and have parity detection enabled, or all SCSI devices have parity detection disabled or not implemented). Parity is not valid during the ARBITRATION phase.

If Atari or the ICD Link hostadapter can't handle parity, that's mainly their problem, as a host adapter which generates parity has no such problems. There are enough host adapters which will generate parity (which is all that is required, the host adapter nedd not check parity) - the ICD ADSCSI, the TT and Falcon build-in one, the Hard&Soft HA, plus some more.

BL>In actual fact, WD-support admits "...yeh, well, the design people intended to
BL>have this, but, ah, actually, it wasn't implemented..." Folks, there just
BL>aren't any disable components installed in the hardware!!! The (*)ing jumpers
BL>simply aren't connected anywhere. Parity is _hard-wired_ !!!

OK, that's a real WD-made problem :-)

BL>Of course, things are never really that simple. I've previously used a WD drive
BL>in a TT with no problems. Same WDSP4200 model. What I _think_ happened is that

see above, the TT does generate parity.

BL>the later volume production series, made in Asia, simply saved on production
BL>costs by leaving these components out, since, hey, most PC clones won't know
BL>the diff since they all use parity checking.

Hm - *not* generating or checking parity would be cheaper, so this can't be the reason. The jumper alone does not cost so much that anyone would leave this out.

BL>before we try it. Indications are that as a result of cost pressures, more and
BL>more SCSI drives are being produced with _hard-wired_ parity checking, and the
BL>documentation is then just plain wrong. Known examples (in Sweden):
BL> o Western Digital: "all SCSI drives" (probably all made '92 or later)
BL> o Quantum: many? most? all? late production ELS models

Can you prove that the Quantum docs are wrong? As far as I know, there are no parioty jumpers, but you can either select parity/no parity by software or it

is determined by the type of on-drive-bios you choose when buying the drive.

BL>[-^-<snap>-^-]
BL>Why bother if this isn't necessary as you say?

It is necessary when connecting to a Link host adapter. My drives work fine
with parity enabled on my ICD ADSCSI (LPS240/CP3100)

You might try emailing them. Their address is:

76004.1600@compuserve.com (ICD Inc)

Their GENIE accounts are ICD and M1220. Genie recently opened up an
Internet gateway address (which I don't know offhand).

>TT030 _requires_ parity check disable, just like the other host-adapter
>SCSI
>solutions for the ST/STE models.

Both TT and Falcon030 have the same NCR 5380 SCSI controller chip, which requires parity enabled. (Mostly because one cannot turn parity check off due to a design bug in the chip.)

But: The AHDI driver doesn't care about incoming parity errors, so having a drive with parity disabled doesn't matter for secure operation of THIS drive.

Butbut: If there's a third unit attached that expects parity, it might get upset. So better turn parity on on all units.

>I've checked with folks that ought to know, who handle this daily, and
>it fits
>my own experience (except for F030, which I've not handled).

Well, as an Atari dealer, it's my daily job to correctly set up Atari systems and their additional hardware. (And it's been my job ever since the ST came out, so I've seen more than one unit leaving my desk :-)

bye, Peter

Sigh.

Same old problem. Conner drives have no "disable parity" feature, so they won't work with adaptors that don't support parity. Check your ICD manual or phone ICD.

4803. Falcon 25/32

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-25 00:01:02 UTC
From: rickard.troedsson@troed.ct.se
Message-ID: <2ca318fe@troed.ct.se>
Source record: 36548

Questions:

What are the possibilities of succeeding in clocking the base Falcon030's processor at 25Mhz? (32Mhz?)

I've heard rumours of people using their Falcon030's at 32Mhz (and the DSP running at 48Mhz!), but before I start playing with my little bird I want to know the technical aspects on this subject .. I know that 99% of all Motorola 68030 16Mhz can do 25Mhz with no problems at all, but will the internal bus-structure cope with that? 32Mhz should work but then there's the risc that the 68030 will overheat and add 1 and 1 to 3...

Also, I've heard that the reason the 16-bit datapath is not crippling the Falcon is because the the whole internal bus-structure runs at 32Mhz, that would mean that running the 68030 at 32Mhz too would indeed show that the 16-bit datapath makes it slower than if it had been 32bit?

Tough questions maybe, but I really need to get an answer .. There's a lot of people out here not buying a Falcon because it's "only" 16Mhz ... an easy way to get 25 or maybe 32Mhz out of the base Falcon would indeed sell a few more ...

One more thing ... What's needed to put a 68030 in the internal processor slot? Pins etc, and would the Falcon automatically know which one to use? What are the bus structures like from that slot compared with the normal CPU paths?

I *LOVE* my Falcon.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been using PeaceBug with success on a TT and a MegaSTe, and it works okay on a Falcon030. But when I use FalconScreen for 768x576 mode, the screen of PeaceBug gets totally scrambled! I tried to use the configuration program to set the screen parameters, but the german documentation is of no help to me (a non-german speaker).

Email to FREDDY@ezrz1.vmsmail.ethz.ch bounces. Does anyone know where Emanuel Moecklin has gone to?

Or has anyone managed to get PeaceBug to work together with FalconScreen in the 768x576 16 color mode?

-Dan

4805. Mxalloc() - Does it allocate?!?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-25 07:03:54 UTC

Message-ID: <H.eg.XgkLmO_p0s6@elfhaven.ersys.edmonton.ab.ca>
Source record: 36462

Hi,

Could someone tell me if the Mxalloc() system call actually allocates memory, or does it just set an already allocated block to the requested mode? I have been told that this is a system call, so it has nothing to do with the C library -- either your systm has it, or not. My system does NOT have it, though, since I do not have a Falcon/TT.

Also, will it return -255 if the function does not exist? (Other Gemdos functions do this, like Syield() (though this would be a MiNT extension).

Any help would be appreciated.

4806. TOS Upgrade Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-25 08:29:44 UTC
From: john@albemuth.equinox.gen.nz
Message-ID: <H.eg.LsmPqDZDKP6@albemuth.equinox.gen.nz>
Source record: 36558

Hi there,

I've been having some problems with a TOS upgrade. I have a 1040STFM with TOS 1.02 and decided to finally upgrade to TOS 1.04. Everything went fine installing the ROMS (it's not particularly tricky) but the computer refused to boot with the new ROMS. There seems to be nothing wrong with the computer as it runs fine under 1.02 (and still is now i.e. no damage seems to have been done by attempting the upgrade). The machine has a Rev C motherboard. The old 1.02 ROMS have the numbers C101831-002 and C101832-002 on them if this helps in identifying anything.

Some questions:

1) Has anyone else experienced this? as my technician friend who has worked with ST's for quite a while hasn't run across anything like this before.

2) Is there anything specific about REV C Motherboards which are different enough to cause this sort of problem?

3) Are there any other weird dependancies between certain revisions of Hardware and TOS that could have some bearing on this??

Any help would be much appreciated.

Cheers,

I have another strange problem with my falcon - a number of programs seem to not work with the DSP!! If I run Audio Fun Machine, Winrec, or the DSP fractal generator, they cant use the DSP (AFM says "Cannot Load DSP code", or something similar).

However, the D2D recorder and SAM and Speeder (which I belive uses the DSP chip to do scaling and rotation) all work OK, although D2D does sometimes complain that it has to reset the DSP to work.

So, what could be wrong? All of this stuff worked just s little while ago...

As always, any help is appreciated!!

Thanks,

I dont know if its the same problem, but when I run, say WinRec,
exit, and then try to run AFM, or anything else, my machine crashes.
AFM says the same thing, but still crashes. I then reboot, and all is
well.
Of course, thats an ulgy fix, and it seems that perhaps the DSP
is not being released properly? Since it shows up in all the DSP stuff
I have, I would have to assume its a bug from Atari...

I haven't tried Before Dawn but you could try a program such as PRGFLAGS or
CHPROT to set the memory protection control flags in the header of your .ACC or
.PRG file to 'global' or 'supervisor' mode.

If this doesn't work, I'm lost.

>16ms for the IDE (Can't rememeber exactly), and 750K/s at 34ms and
>450K/s at
>65ms
>for the other drives.

800 KB/s seems OK for the Falcon's internal drive.

For the SCSI drive: I've seen RateHD several times before displaying complete nonsense for SCSI drives on TTs. (Never tried it on a Falcon, though.)

One time it said 900 KB/s for a Conner 30210 drive, where a program measuring GEMDOS file access and read/write speed displayed 1500 KB/s data rate for reading.
A Quantum LPS240 showed 1300 KB/s in RateHD and 2200 KB/s in the latter program. (That is How-Fast.PRG, btw.)

Seems ICD has a strange bug in there, RateHD should in any case display a higher rate than How-Fast, since RateHD measures raw transfer rate of a 2MB block. How-Fast reads and writes files through GEMDOS.

bye, Peter

>
> Someone told me this had been taken out in later versions (I have 6.08
> which it is in)... anyone know any better?
>
Yeah, seems like later versions, such as 6.2.0, include MiNT.PRG and
ICDCDZ2.XFS plus some doc-file about this...

[-v-<snip>-v-]
ICD's CD-ROM drive software, in conjunction with the included MinT package,
allows the use of standard SCSI-II-compatible CD-ROM drives connected to an
ICD Advantage ST, AdSCSI ST, or The Link host adapter. NOTE: some older
CD ROM drives are not SCSI-II and will not work with this software.

ICD's XFS and MinT will access both High Sierra and ISO-9660 format CD ROMs.

INSTALLATION

Installing the CD-ROM software is fairly straightforward. In the CDROM
folder on the diskette, copy MINT.PRG from the AUTO folder to your present
AUTO folder. This is usually on drive C: if you boot from a hard drive,
or drive A: if you boot from diskette. Note that MINT.PRG must be physically
the last program in your AUTO folder. ...

Copy the file ICDCDZ2.XFS into the root or main directory of the same drive
that your AUTO folder is on. The name of this file may have to be changed;
the characters after "ICDCD" indicate the logical drive that your CD ROM
files will be under and SCSI ID of your CD ROM drive.

ICDCDdi.XFS
^^
|\
| \
| ---- is the SCSI ID of your drive unit (0 through 7).
\
\
\
---- is the logical drive you will use.

```
ICDCDZ2.XFS
^^
|\
| \
| ---- indicates SCSI ID of 2.
\
\
\
---- indicates drive Z:.
```

If necessary, do a 'Show Info' and rename this file as needed.

Now, reboot your computer. Your bootup will proceed as normally, and MinT should install at the end of your AUTO folder. MinT will load your XFS file and show the SCSI Inquiry of your CD ROM unit.

[-^-<snap>-^-]
S'pose this is ok if you want to run MiNT :-)

hi!

I found an old Mega ST2 with some problems at the SH205 drive.
I would like to connect it to a PhoneNET AppleTalk network
mainly to run Mac software (it's already there with
the old Spectre emulator), to use the machine as
a telnet terminal.
Do you find it's a good idea, or is there any other inexpensive
way to use this computer as a terminal on a network?
It's a pity to look at this machine being there unused in
a corner with new Macs around used as terminals...

Please answer by email too if you can...

I remember reading somewhere that only a single program can be in
DSP memory at a time. The thing I don't remember is how you remove
a program once its in DSP memory. I thought there was a menu entry
for doing that, but forget where I encountered it (desktop or program
specific menu.) Wayne

Some programs don't seem to be 'smart' enough to reconfigure the sound
system if SAM is installed. If you remove SAM or at least disable
system sounds, the other programs should work fine. At least, this
is what it took to work on my Falcon.

*> until it fails; normal TOS is limited to 7 created windows. 7 - # of
*> wind_create()s you did will be the number of open windows. Maybe.
*> That's probably about the only way, and it's pretty gross.
*> --
*> --------------------============================================------------
*> ------
*>
*> cherborth@semprini.tdkcs.waterloo.on.ca
*> Chris
*> Herborth
```

Even with MTOS, you can only access drive window a total of 7 times. Try to open more than 7 and you will get a message telling you to close one. There is no limit on the number of program windows however.

I remember reading somewhere that only a single program can be in
DSP memory at a time. The thing I don't remember is how you remove
a program once its in DSP memory. I thought there was a menu entry
for doing that, but forget where I encountered it (desktop or program
specific menu.) Wayne

That is true, but the problem I have is that some programs that used
to run just don't run at all any more, weither or not a program is
already in the DSP. Unless I have the first case ever of a DSP virus? :-)

The only other thing I can think of to try is to interchange the two ROMs..

I vaguely remember something about some confusion over the part numbers of various versions of TOS, so it's possible you have the high and low ROMs reversed.

LR> I have a hard-drive and am running TOS 1.2 with no problems. Are there
LR> some
LR> bug fixes in TOS 1.4 that would make it worthwhile to upgrade, or are the
LR> enhancements things that most users could live without???

Yes yes yes yes yes yes yes!!!

1.2 has some nice enhancements over 1.0, but introduces enough problems of its own to seriously hamper your system. 1.4 adds the extended file selector, file MOVES, some new TOS calls, better directory management, better hard drive support and lots of internal speed improvements. 1.4 just plain runs faster than 1.0/1.2.

Lots of people are unloading their 2/6 chipset for cheap as they upgrade to 2.06 (which you should consider even more than 1.4 if you can put a TAB board in your machine). Look around for it. 1.4 is plug an play on any 520/1040ST (no e!).

Hi-

Yes, before you refer me to the Pexec Cookbook, I've read it... :-)
I'm still having trouble with the 'Load & No-Go' option, though. My
stuff seems to load just fine (the returned 'bp' looks reasonable, for
example), but it doesn't seem to want to run. I've tried putting the
'bp' pointer in each of the three 'ptr' positions of the second Pexec
call, in turn, to no avail. Has anyone successfully & repeatably set
up a scenario where one prg loads another without executing it
immediately, then later executes it? If so, what did you do? Is
there a trick? (Doing it with the 'Load & _GO_' option works just
fine, BTW...)

I'm using HSC 1.40 (not that it should matter, though).

Thanks-
John

4834. Turning a Falcon into a toaster.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-27 23:12:22 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <287s0m$mpi@news.dmpe.CSIRO.AU>
Source record: 36583

Hi!
I got my Falcon last Thursday, and while it has been a relatively fun thing, I have come to a grinding halt after last night. I have been trying out some of the software available for the Falcon, and was testing some stuff on my F: partition. I ran a couple of programs, and then exited back to the desktop. To my amazement, the File Menu was now in German! (My machine is a UK Falcon, 4/80.) I thought, hey, it's just something buggering around inside memory.
I power down for about two minutes.
Still in German.
Again I do the same.
Still Deutsch.
I repeat the process a few times, and then decide that I have corrupted some files on my C: boot partition. No problems. I've got all the install disks, I'll just wipe it all off and re-install.
Cleaned up, re-installed.
Still in German.
Zero'ed the C: Partition, Booted from floppy.
Still in German.
Killed the bootsector, thinking it was a virus.
Still in German!

As you can see, I'm getting real desperate. The german dialogs aren't so bad, I need to learn German again anyway, but the F#$%ing keyboard is German now too, and I even managed to get a Shaft Ess? i.e. a greek Beta, out of the keyboard, and the Y and Z are swapped around. Now for all you techies out there, here is a brief run-down as from SYSINFO version 8.23 (1992):
SYSTEM INFO:
Type : Unknown.
Processor : 68030.
Frequency : 26 Mhz?
Co-Pro : Not Available.
Tos Ver: 4.04, 08-08-1993
Gem Ver: 0.30, 08-03-1993
Aes Ver: 3.40
Tos Nationality : unkown (Ram-Tos?)
Tos Size: 512k
GDOS : Available
Blitter : Available and On.
DMA Sound : Available.
Cookie-Jar : Available at $000980
Cookie-Jar Size : 32 Slots = 256 bytes
Long Stackframe : Yes.
Total ST-Ram : 4096kbytes.

Well, that's it. Also, my copy of MultiTos don't work real well. Oh yeah - when I am in multi-Tos mode, the prompts change back to english, but I think the keyboard is still German!
Phew! What a mouthful! I hope you guys can help, because otherwise I might be forced to get rid of my Falcon and buy something else....

Karl.

No both versions are on 2 ROMs. So there shouldn't be any problem with
this.

The problem seems to be happen somewhere in the hardware initialisation
phase as when the machine is turned on the disk drive momentarily goes
but nothing else happens. It seems really weird!!

Well, I doubt it would be slower than a standard falcon, but there would be a BIG difference in say raytracing (is there anybody out there who knows any way of splitting calculations into two trees, one for the free-standing co-processor, and one for the cpu.. (dsp & 68030 on falcon, 68881/2 & 68000 on a extended ST)

From: lordthan@news.delphi.com
Message-ID: <288rh7$j6u@news.delphi.com>
Source record: 36589

Sorry if this post isn't in the correct reoom, but this is the only ST room Delphi gets. :/

I need an internal floppy drive mechanism and a power supply for my Atari 1040STf. The mechanism is the kind with the wide trapezoid-shaped button on the bottom, not the one with the little square button on the lower corner. DS/DD mechanisms only, please. :)

I'd expect both parts to be functional and in excellent shape, of course.

I'm also interested in hearing any oreasonable offer people have on a new ROM set for my ST (I haven't used in in quite awhile, so I don't know what vresion is in there. I *do* know that the ROMs that are in there are pre-Rainbow TOS ROMs, and that there are five chips socketed to the motherboard. And finally, if anyone has a good hard drive for sale (at least 40-MB, 80-MB or above preferred) I'd ike to hear prices on that, too. :)

Thanks!

Reply in mail, please.

-Steve

Still in German!

<rest of tale deleted>

Aha!! I almost did the same thing to myself, but fortunatley realized what I had done before I rebooted. Fear not, there is hope!!

You innocently ran a program called "nvreset", availiable in the package NVRAM on atari.archive.umich.edu. This resets your Falcons nvram (permanent memory, stays even after a powerdown). Now normally this wouldn't be such a bad thing, but the version I had (and I guess you too!!) was compiled by some fun-loving german who I am sure is having a merry chuckle at our expense - for, you see, it resets the Falcon's NVRAM to the GERMAN default!!

The solution, as usual, lies in the problem - you need to get the NVRAM package again, and install the NVRAM cpx. Using this CPX, you can reset your Falcon to once again be a true blue American computer - just click on each of the options (desktop, language, etc.) and change them from whatever they are to USA. Don't forget to switch back from PAL to NTSC while you're there... Whew!!

Say, does anyone out there know what the three upper right options for NVRAM do? I just leave 'em all on at the moment...

I would also like to take a moment to publicly humiliate myself by stating that the problem I had earlier with my DSP was really no problem at all... just as someone (e-mail? posting? I forget) had said, I had set the application default to be the top window, so AFM just couldn't find its DSP code when it tried to run! Silly me... I still think my audio is messed up, I've tried everything up to sacrificing chickens over the keyboard, but still get a rather annoying hum when recording from stereo to ST, no matter where or how I plug the cables. Radio Shack stock must have risen substantially since I started, and I now have enough different audio cables to form three bands. Oh Well.

I still love my falcon, so nah nah nah to those who dislike them.

It looks like something's been set in the non-volatile RAM.

Someone on here may have the Falcon nvram docs so that you can go changing
the values back to normal, I'm afraid I haven't.

It's nothing to do with any disks, viri etc.

Steve

Seem like you got got one these weak 50 kw power sources. Try a stronger
one. Or perhaps you are one of these who are storing their disc boxes upon
their tv or monitor because of the neat flat surface? That's of course
not meant to be as harsh as it sounds... :-)
And then there is the possibility of a dirty drive. BTW:which
TOS are you using ? 1.0, 1.2 (very nasty version) or 1.4 (quiet good) ?
See you, Dirk

Source record: 36452

I too have possibly a TOS upgrade problem. On my Mega 4 STfm I have upgraded from TOS 1.02 to 2.06 using the TEC Bridge. For simple letters I often just use good ol' 1st Word. I boot from a floppy or hard drive, I enter 1st Word, do 1 document, and get started on a second. Then after some quich succession of keystrokes my Mega 4 freezes up with a whole line of bombs. Most surprising with these bombs is that it looks like the machine did a resolution change. In auto I have altboot, edisk21 RAM disk, maccel2, lgselect, and that's about all.

This has now happened two times!! And unfortunately I saved my document to the RAM disk. ;-(Does anybody have any suggestions?

Thanks!

What you've done here is switch your TOS languge version around somehow.

The falcon ROM's contain all the different language versions, and some sort of internal pointer which points to the currently set version. (I haven't a clue how they do this. I just hope no-one uses this to create a resetproof virus....)

What you need is some program to change this back to the UK language version.
I've seen at least two programs that allow you to do this.

fboot.lzh (i think?) and
nvram11.zip (All the text is in german, but you'll be used to this won't you..)

Both are available from atari.archive.umich.edu, amongst other sites, in the Falcon directory.

Hi! I am german so I have a good use for a _german_ Falcon. Why don't you give me
your machine? ;-D

No, no, just kidding. Your Falcon's CMOS setup is changed to german language. You
can't put the setup back by powering the machine off because it's buffered by a
little battery :-|

There _is_ a way to change back to english launguage, of course. Try BOOTCONF.ZIP
from ftp.tu-clausthal.de: /pub/atari/falcon
This program allows you to alter the CMOS setup. Don't change the other boot
preferences, just the language.

Hope this helps,

Chris

I have a question (and possible request). Is there any resolution
limitation when using DEGAS files? That is, could I create a 320x400x16
Degas file (assuming I can get this resolution which I would then have Warp9
use as a background). Basically I'm trying to convert some GIFs and JPGs
to a format that I could use in extended graphics modes as background
pictures, but the only formats that Warp9 supports are Degas, TNY, and
PNT. I guess my request would be to maybe include one (or some) of these
formats as other SAVE choices?

My other suggestion: I know I can halve the size of a picture and
double the size. Have you given any thought to including a RESIZE
option where an *arbitrary* resolution could be resized to (say I wanted
to resize a 800x600 GIF to 640x400).

Anyways, great program...

>Register you program ;-)

4853. Problem with no boot on ICD FAST drive...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-28 16:57:03 UTC
From: brian@dweomer.org
Message-ID: <CE2pr4.C2D@dweomer.org>
Source record: 36454

Greetings all,

In the past week, my ICD 80MB FAST drive has started to refuse to boot off my clunky old Atari 1040ST (original ROMs if that matters). The symptoms are that the ICD upon power up has the red LED come on, then the middle (green) LED lights up for a bit, but not as long as I believe it used to do). I then boot the ST, and wait for it to put up the default desktop associated with the floppy I have in the drive. I then hit the RESET button on the back, which then does the SCSI reset that the ICD has always liked, and starts the reboot.

However, now instead of having the FAST drive start up full board, the green LED comes on momentarily and the default (floppy) boot occurs. I'll chase down ICD for help, but I thought I'd appeal here first.

Thanks for any and all suggestions. I'll summarize any responses I get via Email.

Regards,

4855. NeoChrome to DOS image format (like PCX): HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-28 17:13:01 UTC
From: wjr@pacific.uucp
Message-ID: <289rat$r8u@netline-fddi.jpl.nasa.gov>
Source record: 36451

I am looking for a way to convert Atari NeoChrome images over
to some PC (DOS) format, such as PCX. The NeoChrome images
are standard 320x200x16color.

Are there any conversion programs available to do this?

I have tried to convert the images manually, but I can't
figure out how the NeoChrome Images are stored. I do have
a file discription of NeoChrome format, but it doesn't seem
to be correct. Subtracting the header (something like 128k)
you are left with a 32000 byte file which contains data for
a 320x200 images. This works out to 4 bits per pixel, or
2 pixels per byte (with DN valaues of 0-15 for each pixel),
which is what I expect. But, when I split each bytes to make
a 320x200 array, the pixels do not match the original image.

I have assumed that byte 1 represents pixels 1 and 2 (on scan
line 1), byte 2 represents pixels 3 and 4, and so on. This seems
to be incorrect, but I can't find another way to do it.

If someone has a simple images converter, this problem will
be moot, otherwise if someone can explain how the NeoChrome
image is stored, I would be grateful. If you can tell me
how to convert a 32000 byte NeoChrome image into a 320x200
array with pixel values ranging 0-15, I can do the rest.

Thanks

Joe

>4/80.)

[rest of story deleted... the upshot is, some program has messed with
his NVRAM and made the boot parameters set up for Germany]

There are 2 solutions:

(1) Turn off your machine. Wait 5 minutes (this is for a really cold boot).
Turn it back on. When the Fuji appears, press CTRL-ALT-UNDO. The machine
should then reboot again. (The above is not a typo: it is indeed
CTRL-ALT-UNDO that you should press, not CTRL-ALT-DEL). After the reboot,
the machine should come up with U.S. defaults; not quite what you
want, but at least it will be in English :-). The use of CTRL-ALT-UNDO
to reset the machine's configuration only works for machines with
TOS 4.04, and only during initial booting (i.e. while the Fuji is
on screen and perhaps while the memory is being tested).

(2) Or, get a copy of the CONFIG.PRG program from your local BBS or
FTP site. (Some places may call this FCONFIG.PRG). This is a program
that lets you change the boot nationality for your machine.

VDI screen coordinates normally have their origin in the upper lefthand
corner of the screen. The origin definitely does not depend on the
position of the active window, because the AES is "above" the VDI.

> 1.44 meg floppies are cheaper than 720K ones these days.....

Yes, that should be no problem. You will only have to set some jumpers
on the drive to make it recognize the kind of disk you insert instead
of being controlled by one pin on the interface to the controller.

Message-ID: <28b1lq$rtd@news.dmpe.CSIRO.AU>
Source record: 36463

Thanks to eveyone who replied to my Falcon -> Toaster conversion utility problem. I tracked it down, and now have a more useable(!) falcon that boots up in 640*480*256 automatically. So the ROMS are Multilingual! Cool. As for Kendall's question about the top three bars in the NV_RAM CPX, Off hand I remeber that the middleone? (Dopple ...) means 'double line' mode, and the compaibl...modus one whacks the Falcon into a ST? compatible mode. I'll sit down and translate the whole thing into english tonight, and post it if anyone wants a copy!
(I'll need some encouragement though!)

Best Regards,

Karl.

4864. DMA controller

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-29 04:50:29 UTC
From: fant@nextnet.csus.edu
Message-ID: <1993Sep29.045029.1291@csus.edu>
Source record: 36464

I think I destroyed my DMA controller in my ST.
Does anyone know the price for a new part or a source for used parts.

Maybe someone has a damaged ST that they would be willing to sell cheap.

It's an old slow machine, but I like it.
Thanks for the information,
Steve Miller (KB6ZVM)

4865. 19-inch monitor on TT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-29 04:59:54 UTC
From: gkirkaldie@sanity.tdkcs.waterloo.on.ca
Message-ID: <H.ea.t7HCKxFMqpM@sanity.tdkcs.waterloo.on.ca>
Source record: 36497

Does anyone know the horizontal and vertical scan frequencies of the TT in TT-High?

We've got a 19" ECL monitor and a cable we made, and the video seems proper, but the sync's seem off.

So, I'm looking for someone who's adapted a non-Atari monitor to work with their TT. And any suggestions would be appreciated.

Oh, the monitor is called something like L-View or similar.

4866. Hardware documentation 6.0 available

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-29 06:26:59 UTC
From: goemon@venice.mps.ohio-state.edu
Message-ID: <28b9rj$qpk@sol.ctr.columbia.edu>
Source record: 36466
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The (in?)famous "Hardware documentation", revision 6.0 is now available.

It lists every known (and unknown) hardware register in every Atari
from the ST to the Falcon030, and everything in between. It also
details most of the register's functions.

This document is available on your favorite atari ftp site, or if you
can't get it, I can email a copy to you. It will be compressed
and uuencoded, however. No exceptions.

It is available on most atari ftp sites as "hardware.txt".

4867. Compiling Mint 1.08 ; problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-29 07:56:59 UTC
From: jbww@ukc.ac.uk
Message-ID: <5933@eagle.ukc.ac.uk>
Source record: 36467

I have just tried compiling Mint 1.08, and have problems with
multiple definitions of main. I thought the solution was to use
an older Gcc, but that does not seem to help. Can anyone suggest
something I can try ?

At the final linking stage I get :

```
j:/gcc/bin.233/gcc.ttp -G -Wall -O2 -fomit-frame-pointer
-mshort -DMULTITOS -DDEBUG_INFO -o mint.prg
bios.o xbios.o console.o dos.o dosdir.o dosfile.o dosmem.o
dossig.o filesys.o main.o mem.o proc.o signal.o timeout.o tty.o util.o
biosfs.o pipefs.o procfs.o tosfs.o debug.o rendez.o unifs.o shmfs.o
fasttext.o welcome.o nalloc2.o memprot.o realloc.o context.o intr.o
syscall.o quickzer.o quickmov.o cpu.o -liio16

j:/gcc/bin.233/gcc-ld.ttp: multiple definitions of symbol `__main'.
Files: /dev/j/olib\gnu16.olb(main.o) main.o
j:/gcc/bin.233/gcc-ld.ttp: multiple definitions of symbol `_exit'.
Files: /dev/j/olib\gnu16.olb(main.o) main.o
mem.o: Undefined symbol _xbios referenced from text

make: *** [mint.prg] Error 1
```

I have tried recompiling main.c with Gcc versions 2.3.3, 2.4.2, 2.4.4
and linking with gnu16.olb from gnuolb versions 85, 87, 93.

Any ideas as to what I should try ? (or have I just done something wrong ?)

Cheers,
beau webber jbww@ukc.ac.uk

>memory, or does it just set an already allocated block to the requested

It allocates memory like the normal Malloc() call does. The only difference
is that you can specify the kind of RAM to be allocated, i.e. ST compatible
RAM or not.

>mode? I have been told that this is a system call, so it has nothing
>to do with the C library -- either your systm has it, or not. My
>system does NOT have it, though, since I do not have a Falcon/TT.

Yes, it's a GEMDOS call available since TOS 2.0. It doesn't depend on your
machine but on your TOS version, i.e. an ST with TOS 2.06 will support Mxalloc,
too.

It's like Malloc(), it just has one more parameter.

Hi,

I have a ICD formatted and partioned HD. I would like to know if there
is a utility that aloows you to make ICD formated HDs AHDI compatible.
Is there something like this? Or has someone a documentation of that
ICD format?

Thanx in advance,

Marcus

Mxalloc() actually allocates memory; it's just like Malloc, except it allows
you to choose the attributes (ST or TT RAM, and memory protection
attributes under MiNT) of the memory you're allocating.

>Also, will it return -255 if the function does not exist? (Other
>Gemdos functions do this, like Syield() (though this would be a MiNT
>extension).

As far as I know, calling a non-existent GEMDOS function should always
return -32 (EINVFN).
